Limit theory for high frequency sampled MCARMA models

Vicky Fasen∗†

August 23, 2012

We consider a multivariate continuous-time ARMA (MCARMA) process sampled at a high-frequency time-grid \{h_n, 2h_n, \ldots, nh_n\} where \(h_n \downarrow 0\) and \(nh_n \rightarrow \infty\) as \(n \rightarrow \infty\), or at a constant time-grid where \(h_n = h\). For this model we present the asymptotic behavior of the properly normalized partial sum to a multivariate stable or a multivariate normal random vector depending on the domain of attraction of the driving Lévy process. Further, we derive the asymptotic behavior of the sample autocovariance. In the case of finite second moments of the driving Lévy process the sample autocovariance is a consistent estimator. Moreover, we embed the MCARMA process in a cointegrated model. For this model we propose a parameter estimator and derive its asymptotic behavior. The results are given for more general processes than MCARMA processes and contain some asymptotic properties of stochastic integrals.

Keywords: central limit theorem, cointegration, domain of attraction, high-frequency data, multivariate CARMA process, regular variation, Ornstein-Uhlenbeck process, sample autocovariance.

1. Introduction

Multivariate continuous-time ARMA (MCARMA) processes \(V = (V(t))_{t \geq 0}\) are the continuous-time versions of the well-known multivariate ARMA processes in discrete time having short memory. They are important for stochastic modelling in many areas of application as, e.g., signal processing and control (cf. [20, 26]), econometrics (cf. [2, 32]), high-frequency financial econometrics (cf. [45]), and financial mathematics (cf. [1]). Starting at least with Doob [13] in 1944, Gaussian CARMA processes under the name Gaussian processes with rational spectral density appeared, where the driving force is a Brownian motion. To obtain more flexible marginal distributions and dynamics Brockwell (cf. [6, 7]) analyzed Lévy driven CARMA models, which were extended by Marquardt and Stelzer [28] to the multivariate setting; see [8] for an overview and a comprehensive list of references.

Lévy processes are defined to have independent and stationary increments, and are characterized by their Lévy-Khintchine representation. An \(\mathbb{R}^m\)-valued Lévy process \((L(t))_{t \geq 0}\) has the Lévy-Khintchine representation \(\mathbb{E}(e^{i\theta L(t)}) = \exp(-r\Psi(\theta))\) for \(\Theta \in \mathbb{R}^m\), where \(\Theta^t\) is the transpose of \(\Theta\) and

\[
\Psi(\Theta) = -ir_L\Theta + \frac{1}{2} \Theta^t \mathcal{S}_L \Theta + \int_{\mathbb{R}^m} \left(1 - e^{ix^t\Theta} + ix^t\Theta 1_{\{|x|^2 \leq 1\}}\right) \nu_L(dx)
\]

with $\gamma_L \in \mathbb{R}^m$, $\Sigma_L$ a positive semi-definite matrix in $\mathbb{R}^{m \times m}$ and $\nu_L$ a measure on $(\mathbb{R}^m, \mathcal{P}(\mathbb{R}^m))$, called the Lévy measure, which satisfies $\int_{\mathbb{R}^m} \min\{\|x\|^2, 1\} \nu_L(dx) < \infty$ and $\nu_L(\{0\}) = 0$. The triplet $(\gamma_L, \Sigma_L, \nu_L)$ is called the characteristic triplet, because it characterizes completely the distribution of the Lévy process. A two-sided Lévy process $(L(t))_{t \in \mathbb{R}}$ is then a composition of two independent and identically distributed Lévy processes $(L^{(1)}(t))_{t \geq 0}$ and $(L^{(2)}(t))_{t \geq 0}$ in

$$L(t) = \begin{cases} L^{(1)}(t) & \text{for } t \geq 0, \\ L^{(2)}(-t) & \text{for } t < 0. \end{cases}$$

We refer to the excellent monograph of Sato [42] for more details on Lévy processes. In this paper the driving Lévy process is very general. It is allowed to have both a finite variance $\mathbb{E}\|L(1)\|^2 < \infty$ and an infinite variance $\mathbb{E}\|L(1)\|^2 = \infty$, which is modelled by a multivariate regularly varying Lévy process.

CARMA processes driven by infinite variance Lévy processes are particularly relevant in modelling energy markets, see Garcia et al. [19], for instance. We will investigate CARMA processes (see Definition 2.1) observed not only at a constant frequency $h$ but also, especially for high frequencies as found in finance and turbulence. Then the observation grid is $\{h_n, 2h_n, \ldots, nh_n\}$, where $h_n \downarrow 0$ and $\lim_{n \to \infty} nh_n = \infty$. The behavior of the spectral density of a high frequency sampled CARMA model and kernel density estimation was recently explored in Brockwell et al. [5, 9]. The estimation of the spectral density and the model parameters is topic of Fasen and Fuchs [17, 18]. For the statistical inference of a CARMA process, e.g., parameter estimation and hypothesis testing, it is crucial to know the asymptotic behavior of the partial sum (cf. [17, 18]). We will show the convergence of the properly normalized partial sum to an $\alpha$-stable random vector, where $\alpha = 2$ reflects the multivariate normal distribution. In the high frequency setting the limit distribution factorizes in a random factor independent of the CARMA parameters and a deterministic vector, where

$$\mathbb{E}\|x\|^2 = \sum_{i,j=1}^m \Sigma_{ij} \mathbb{E}x_i x_j.$$
and the cointegrated model as

\[
\begin{align*}
Y_{n,k} &= AX_{n,k} + Z_{n,k} \quad \text{for } n,k \in \mathbb{N}, \quad \text{in } \mathbb{R}^d, \\
X_{n,k} &= X_{n,k-1} + \epsilon_{n,k} \quad \text{for } n,k \in \mathbb{N}, \quad \text{in } \mathbb{R}^v.
\end{align*}
\]

(1.4)

In this case the observation scheme is

\[
\begin{align*}
\mathcal{Y}^\prime_n &= (Y_{n,1}, \ldots, Y_{n,n}) \in \mathbb{R}^{d \times n}, \\
\mathcal{X}^\prime_n &= (X_{n,1}, \ldots, X_{n,n}) \in \mathbb{R}^{v \times n}.
\end{align*}
\]

(1.5)

Since the high frequency sampled MCARMA process \((V(\kappa h_n))_{\kappa \in \mathbb{R}}\) has a representation as in (1.3) and

\[
L_2(k h_n) = L_2((k-1) h_n) + [L_2(k h_n) - L_2((k-1) h_n)],
\]

where \((L_2(k h_n) - L_2((k-1) h_n))_{k \in \mathbb{N}}\) is an iid sequence by the independent and stationary increment property of a Lévy process, (1.2) can be interpreted as a special case of (1.5). As estimator for \(A\) we use the least squares estimator

\[
\hat{A}_n = \mathcal{Y}^\prime_n \mathcal{X}^\prime_n (\mathcal{X}^\prime_n \mathcal{X}^\prime_n)^{-1}.
\]

(1.6)

The paper is structured in the following way. First, in Section 2 we present some preliminaries on MCARMA processes, regular variation and model assumptions. The main results of this paper on limit theory for high-frequency sampled MCARMA processes but also for equidistant sampled MCARMA processes are topic of Section 3. We show that the properly normalized partial sum \(\sum_{n=1}^N V(k h_n)\) and the sample autocovariance \(\sum_{n=1}^N V(k h_n) V(k h_n)'\) of the MCARMA process with either \(h_n \downarrow 0\) and \(n h_n \to \infty\) as \(n \to \infty\), or \(h_n = h\) (but with different normalization) converge weakly, and we completely characterize their limit distributions. Moreover, we investigate the cointegrated model (1.1)-(1.2). All results are compared to multivariate ARMA models in discrete time. The proofs of this section are based on some general limit theorems as constituted in Section 4. There we present under some general assumptions the asymptotic behavior of \(\hat{A}\) for the multivariate cointegrated model (1.4)-(1.5). Finally, Section 5 contains the proofs of the stated results and the Appendix A involves the asymptotic behavior of stochastic integrals where the driving Lévy process has either a finite second moment or is multivariate regularly varying. On the one hand, these results are interesting for their own but on the other hand, they act as preliminaries to the results in this paper.

We use the notation \(\Rightarrow\) for weak convergence, \(\rightarrow\) for convergence in probability, and \(\overset{v}{\Rightarrow}\) for vague convergence. Let \(\mathbb{R} = \mathbb{R} \cup \{-\infty, \infty\}\) be the compactification of \(\mathbb{R}\) and let \(\mathcal{B}()\) be the Borel-\(\sigma\)-algebra. For two random vectors \(X, Y\) the notation \(X \overset{d}{=} Y\) means equality in distribution. We use as norms the Euclidean norm \(\|\cdot\|\) in \(\mathbb{R}^d\) and the corresponding operator norm \(\|\cdot\|\) for matrices, which is submultiplicative. Recall that two norms on a finite-dimensional linear space are always equivalent and hence, our results remain true if we replace the Euclidean norm by any other norm. For a measurable function \(f : (0, \infty) \to (0, \infty)\) and \(\alpha \in \mathbb{R}\) we say that \(f\) is regularly varying of index \(-\alpha\), if \(\lim_{x \to \infty} f(tx)/f(x) = x^{-\alpha}\) for any \(t > 0\), and we write \(f \in \mathcal{R}^{-\alpha}\). The set of \(d \times m\) matrices over \(\mathbb{R}\) is denoted by \(M_{d \times m}(\mathbb{R})\). The matrix \(0_{d \times m}\) is the zero matrix in \(M_{d \times m}(\mathbb{R})\) and \(I_{d \times d}\) is the identity matrix in \(M_{d \times d}(\mathbb{R})\). For a vector \(x \in \mathbb{R}^d\) we write \(x^\prime\) for its transpose and for \(x \in \mathbb{R}\) we write \(|x| = \sup\{k \in \mathbb{Z} : k \leq x\}\). The space \(\mathcal{D}[0,1,\mathbb{R}^d]\) denotes the space of all càdlàg (continue à droite et limitée à gauche = right continuous, with left limits) functions on \([0,1]\) with values in \(\mathbb{R}^d\) equipped with the Skorokhod \(J_1\) topology. Finally, for a semimartingale \(W = (W_1(t), \ldots, W_d(t))_{t \geq 0}\) in \(\mathbb{R}^d\) we denote by \([W,W]_t = (\langle W_i, W_j \rangle_t)_{i,j=1,\ldots,d}\) for \(t \geq 0\) the quadratic variation process.

2. Preliminaries

2.1. MCARMA process

Let \(L_1 = (L_1(t))_{t \in \mathbb{R}}\) be a two-sided \(\mathbb{R}^m\)-valued Lévy process and \(p > q\) are positive integers. Then the \(d\)-dimensional MCARMA\((p,q)\) model can be interpreted as the solution to the \(p\)-th-order \(d\)-dimensional
stochastic differential equation

\[ P(D)V(t) = Q(D)DL_t(t) \quad \text{for } t \in \mathbb{R}, \]

where \( D \) is the differential operator,

\[ P(z) := I_{d \times d}z^p + P_1z^{p-1} + \ldots + P_{p-1}z + P_p \quad (2.1) \]

with \( P_1, \ldots, P_p \in M_{d \times d}(\mathbb{R}) \) is the auto-regressive polynomial and

\[ Q(z) := \begin{pmatrix} Q_0 & \cdots & Q_q \end{pmatrix} z^q + \cdots + Q_{q-1}z + Q_q \quad (2.2) \]

with \( Q_0, \ldots, Q_q \in M_{d \times m}(\mathbb{R}) \) is the moving-average polynomial. Since a Lévy process is not differentiable, this definition cannot be used, however, it can be interpreted to be equivalent to the following.

**Definition 2.1.** Let \((L_1(t))_{t \in \mathbb{R}}\) be an \( \mathbb{R}^m \)-valued Lévy process and let the polynomials \( P(z), Q(z) \) be defined as in (2.1) and (2.2) with \( p, q \in \mathbb{N}_0, q < p, \text{ and } Q_0 \neq 0_{d \times m} \). Moreover, define

\[ \Lambda = \begin{pmatrix} 0_{d \times d} & I_{d \times d} & 0_{d \times d} & \cdots & 0_{d \times d} \\ 0_{d \times d} & 0_{d \times d} & I_{d \times d} & \cdots & \vdots \\ \vdots & \ddots & \ddots & \ddots & 0_{d \times d} \\ 0_{d \times d} & \cdots & \cdots & 0_{d \times d} & I_{d \times d} \\ -P_p & -P_{p-1} & \cdots & \cdots & -P_1 \end{pmatrix} \in M_{pd \times pd}(\mathbb{R}), \]

\[ E = (I_{d \times d}, 0_{d \times d}, \ldots, 0_{d \times d}) \in M_{d \times pd}(\mathbb{R}) \quad \text{and} \quad B = (B_1' \cdots B_p')' \in M_{pd \times m}(\mathbb{R}) \quad \text{with} \]

\[ B_1 := \ldots := B_{p-q-1} := 0_{d \times m} \quad \text{and} \quad B_{p-j} := -\sum_{i=1}^{p-j-1} P_iB_{p-j-i} + Q_{q-j} \quad \text{for } j = 0, \ldots, q. \]

Assume \( \mathcal{N}(P) = \{ z \in \mathbb{C} \mid \det(P(z)) = 0 \} \subseteq (-\infty, 0) + i\mathbb{R} \). Furthermore, the Lévy measure \( \nu_{L_1} \) of \( L_1 \) satisfies

\[ \int_{|x| > 1} \log \|x\| \, \nu_{L_1}(dx) < \infty. \]

Then the \( \mathbb{R}^d \)-valued causal MCARMA\((p, q)\) process \((V(t))_{t \in \mathbb{R}}\) is defined by the state-space equation

\[ V(t) = EZ(t) \quad \text{for } t \in \mathbb{R}, \quad (2.3) \]

where

\[ Z(t) = \int_{-\infty}^t e^{\Lambda(t-s)}BdL_1(s) \quad \text{for } t \in \mathbb{R} \quad (2.4) \]

is the unique solution to the \( pd \)-dimensional stochastic differential equation

\[ dZ(t) = -\Lambda Z(t) \, dt + B \, dL(t). \]

The function \( f(t) = e^{-\Lambda t}B \mathbf{1}_{[0,\infty)}(t) \) for \( t \in \mathbb{R} \) is called kernel function.

In particular, the MCARMA\((1, 0)\) process and \( Z \) in (2.4) are multivariate Ornstein-Uhlenbeck processes. To see that the MCARMA\((p, q)\) process is well-defined compare Marquardt and Stelzer [28]. Moreover, Lemma 3.8 of Marquardt and Stelzer [28] says that the set \( \mathcal{N}(P) \) is equal to the set of eigenvalues of \( -\Lambda \), which means that for a MCARMA\((p, q)\) process the eigenvalues of \( \Lambda \) have strictly positive real parts. The class of MCARMA processes is huge. Schlemm and Stelzer [43], Corollary 3.4, showed that the class of state-space models of the form

\[ d\tilde{Z}(t) = -\tilde{\Lambda}\tilde{Z}(t) \, dt + \tilde{B} \, dL(t), \]

\[ \tilde{V}(t) = \tilde{C}\tilde{Z}(t) , \]

is...
where \( \tilde{\Lambda} \in \mathbb{R}^{N \times N} \) has only eigenvalues with strictly positive real parts, \( \tilde{B} \in \mathbb{R}^{N \times m} \) and \( \tilde{C} \in \mathbb{R}^{d \times N} \) and the class of causal MCARMA processes are equivalent if \( \mathbb{E}\|L(1)\|^2 < \infty \) and \( \mathbb{E}(L(1)) = 0_m \).

2.2. Multivariate regular variation and assumptions

Multivariate regular variation plays a basic part in our model assumption. First, we recall the definition.

**Definition 2.2.** A random vector \( \mathbf{U} \in \mathbb{R}^d \) is multivariate regularly varying with index \( -\alpha < 0 \) if and only if there exists a non-zero Radon measure \( \mu \) on \( (\mathbb{R}^d \setminus \{0_d\}, \mathcal{B}(\mathbb{R}^d \setminus \{0_d\})) \) with \( \mu(\mathbb{R}^d \setminus \mathbb{R}^d) = 0 \) and a sequence \( (a_n)_{n \in \mathbb{N}} \) of positive numbers increasing to \( \infty \) such that
\[
\lim_{n \to \infty} \frac{1}{a_n} \mathbb{P}(a_n^{-1} \mathbf{U} \in \cdot) = \mu(\cdot) \quad \text{on } \mathcal{B}(\mathbb{R}^d \setminus \{0_d\}),
\]
where the limit measure \( \mu \) is homogenous of index \(-\alpha\), i.e., \( \mu(uB) = u^{-\alpha} \mu(B) \) for \( u > 0, B \in \mathcal{B}(\mathbb{R}^d \setminus \{0_d\}) \).

We write \( \mathbf{U} \in \mathcal{R}_{-\alpha}(a_n, \mu) \).

If the representation of the limit measure \( \mu \) or the norming sequence \( (a_n)_{n \in \mathbb{N}} \) does not matter we also write \( \mathcal{R}_{-\alpha}(a_n) \) and \( \mathcal{R}_{-\alpha} \), respectively. For further information regarding multivariate regular variation of random vectors we refer to Resnick [40].

**Definition 2.3.** Let \( \mathbf{U} \) be an \( \mathbb{R}^d \)-valued random vector; \( \alpha \in (0, 2] \), \( (a_n)_{n \in \mathbb{N}} \) be an increasing sequence of positive constants tending to \( \infty \), \( \mu \) be a Radon measure on \( (\mathbb{R}^d \setminus \{0_d\}, \mathcal{B}(\mathbb{R}^d \setminus \{0_d\})) \) with \( \mu(\mathbb{R}^d \setminus \mathbb{R}^d) = 0 \) and \( \Sigma \in \mathcal{M}_{d \times d}(\mathbb{R}) \) be a positive semi-definite matrix. We write \( \mathbf{U} \in DA(\alpha, a_n, \Sigma, \mu) \) if either

\( a_n = \alpha \), \( \Sigma = 0_{d \times d} \), \( \mu \) is non-zero and \( \mathbf{U} \in \mathcal{R}_{-\alpha}(a_n, \mu) \), or

\( a_n = n^{\alpha/2} \), \( \mu = 0 \) and \( \mathbb{E}\|\mathbf{U}\|^2 < \infty \) with \( \mathbb{E}(\mathbf{U}'\mathbf{U}) = \Sigma \).

The abbreviation \( DA \) stands for domain of attraction because of the following argument. Let \( \{\mathbf{U}_k\}_{k \in \mathbb{N}} \) be a sequence of iid \( \mathbb{R}^d \)-valued random vectors with \( \mathbf{U}_1 \in DA(\alpha, a_n, \Sigma, \mu), \alpha \neq 1 \), and \( \mathbf{S} = (S(t))_{t \geq 0} \) be an \( \mathbb{R}^d \)-valued \( \alpha \)-stable Lévy process with characteristic triplet \( (\int_{|x| \leq 1} x \mu(dx), \Sigma, \mu) \) if \( \alpha \in (0, 1) \) and \( (-\int_{|x| > 1} x \mu(dx), \Sigma, \mu) \) if \( \alpha > 1 \). In particular if \( \alpha = 2 \), \( \mathbf{S} \) is a Brownian motion with covariance matrix \( \Sigma \). Assume \( \mathbb{E}(\mathbf{U}_1) = 0_d \) if \( \alpha > 1 \). Then \( a_n^{-1} \sum_{k=1}^{|\mathbf{S}|} \mathbf{U}_k \Rightarrow \mathbf{S} \) as \( n \to \infty \) in \( \mathcal{D}([0, 1], \mathbb{R}^d) \).

This means that the triplet \( (\alpha, \mu, \Sigma) \) characterizes completely the limit distribution and \( (a_n)_{n \in \mathbb{N}} \) the convergence rate. For \( \alpha = 1 \) we need additionally a deterministic shift factor to obtain the convergence, which we can neglect if \( \mathbf{U}_1 \) is symmetric. In general the only possible limit of a normalized partial sum of iid random vectors is an \( \alpha \)-stable distribution with \( \alpha \in (0, 2] \) (cf. Rvačeva [41]). The limit distribution is an \( \alpha \)-stable random vector with \( \alpha < 2 \) if and only if \( \mathbf{U}_1 \) is multivariate regularly varying of index \( -\alpha \). Then also \( \mathbb{E}\|\mathbf{U}_1\|^2 = \infty \). On the other hand, \( \mathbb{E}\|\mathbf{U}_1\|^2 < \infty \) is only a sufficient assumption to be in the domain of attraction of a normal distribution.

3. Main results

We start with a central limit theorem for MCARMA processes in

**Theorem 3.1.** Let \( \{V(t)\}_{t \in \mathbb{R}} \) be an \( \mathbb{R}^d \)-valued causal MCARMA \((p, q)\) process as given in Definition 2.1 driven by the \( \mathbb{R}^m \)-valued Lévy process \( \{L_1(t)\}_{t \in \mathbb{R}} \) with \( L_1(1) \in DA(\alpha, a_n, \mu_1, \Sigma_1) \) and \( \mathbb{E}(L_1(1)) = 0_m \) if \( \alpha > 1 \). Set \( a_t := a_{|t|} \) for \( t \geq 0 \). If \( \alpha = 1 \) we assume additionally that \( L_1(1) \) is symmetric.

(a) Let \( \{S_1(t)\}_{t \geq 0} \) be an \( \mathbb{R}^m \)-valued \( \alpha \)-stable Lévy process with characteristic triplet \( (\int_{|x| \leq 1} x \mu_1(dx), \Sigma_1, \mu_1) \)
if $\alpha \in (0, 1]$ and $(-\int_{|x|>1} x \mu_1(dx), \Sigma_1, \mu_1)$ if $\alpha > 1$. Suppose the sequence of positive constants $(h_n)_{n \in \mathbb{N}}$ satisfies $h_n \downarrow 0$ as $n \to \infty$ and $\lim_{n \to \infty} nh_n = \infty$. Then as $n \to \infty$,

$$h_n a_{nh_n}^{-1} \sum_{k=1}^n V(kh_n) \Rightarrow \left( \int_0^\infty f(s) \, ds \right) S_1(1).$$

(b) Let $h > 0$ and let $(S_{th}(t))_{t \geq 0}$ be an $\mathbb{R}^d$-valued $\alpha$-stable Lévy process with characteristic triplet $(\int_{|x| \leq 1} x \mu_1(dx), \Sigma_t, \mu_t)$ if $\alpha \in (0, 1]$ and $(\int_{|x| > 1} x \mu_1(dx), \Sigma_t, \mu_t)$ if $\alpha > 1$, where

$$\mu_{t,h} = \int_0^h \int_{\mathbb{R}^m} 1_B \left( \sum_{k=0}^\infty f(kh+s)x \right) \mu_1(dx)ds$$

for $B \in \mathcal{B}(\mathbb{R}^d \setminus \{0_d\})$. (3.1)

$$\Sigma_{t,h} = \int_0^h \left( \sum_{k=0}^\infty f(kh+s) \right) \Sigma_1 \left( \sum_{k=0}^\infty f(kh+s) \right)' ds.$$ (3.2)

Suppose $E[\|L_1(1)\|^r] < \infty$ for some $r > 2$ if $\alpha = 2$. Then as $n \to \infty$,

$$a_{n}^{-1} \sum_{k=1}^n V(kh) \Rightarrow S_{th}(1).$$

We shall compare this result to the limit results for ARMA models and present a motivation for the normalization.

**Remark 3.2.**

(a) Let $(\xi_j)_{j \in \mathbb{Z}}$ be a sequence of iid random vectors in $\mathbb{R}^m$ with $\xi_1 \in \mathcal{N}_m(a_n, \mu_1)$ for some $0 < \alpha < 2$. If $\alpha > 1$ then suppose $E(\xi_1) = 0_m$, and if $\alpha = 1$ then suppose $\xi_1$ is symmetric. Furthermore, let $(C_k)_{k \in \mathbb{N}}$ be a sequence of matrices in $M_{d \times m}(\mathbb{R})$ with $\sum_{k=0}^\infty k \|C_k\|^\theta < \infty$ for some $0 < \theta < \alpha$, $\theta \leq 1$. The $\mathbb{R}^d$-valued stationary MA process $(X_k)_{k \in \mathbb{Z}}$ is defined as

$$X_k = \sum_{j=0}^\infty C_j \xi_{k-j} \quad \text{for } k \in \mathbb{Z}.$$ (3.3)

Then a special case of Theorem 4.2 (from below) is that as $n \to \infty$,

$$a_n^{-1} \sum_{k=1}^n X_k \Rightarrow \left( \sum_{k=1}^\infty C_k \right) S_1(1).$$

On the one hand, we observe the similar structure of the limit distribution $(\int_0^\infty f(s) \, ds) S_1(1)\) and $(\sum_{k=1}^\infty C_k) S_1(1)$ in the continuous-time high frequency and the discrete-time model. On the other hand, the normings are different. To explain the different normings we consider an $\alpha$-stable Lévy process $(L_1(t))_{t \geq 0}$ and an $\alpha$-stable random variable $\xi_1$. Then the idea in the continuous-time model is that as $n \to \infty$,

$$h_n a_{nh_n}^{-1} \sum_{k=1}^n V(kh_n) = \left( \sum_{j=0}^\infty f(jh_n)h_n \right) \left( a_{nh_n}^{-1} \sum_{k=1}^n [L_1(kh_n) - L_1((k-1)h_n)] \right) + o_p(1)$$

$$\Rightarrow d \left( \sum_{j=0}^\infty f(jh_n)h_n \right) \left( (nh_n)^{-\frac{1}{\alpha}} h_n^{\frac{1}{\alpha}} \sum_{k=1}^n [L_1(k) - L_1((k-1))] \right) + o_p(1)$$

$$\Rightarrow d \left( \sum_{j=0}^\infty f(jh_n)h_n \right) S_1(1) + o_p(1) = \left( \int_0^\infty f(s) \, ds \right) S_1(1) + o_p(1),$$

$$6$$
In particular, 

\[ a_n^{-1} \sum_{k=1}^{n} X_k = \left( \sum_{j=0}^{\infty} C_j \right) \left( a_n^{-1} \sum_{k=1}^{n} \xi_k \right) + o_p(1) = \left( \sum_{j=0}^{\infty} C_j \right) \xi_1 + o_p(1). \]  

(3.5)

In (3.4) and (3.5) we see where the different normings have their origin. In the continuous-time model, the \( h_n \) of the norming \( h_n a_{nh}^{-1} \) goes into the first factor of (3.4), which converges to \( \left( \int_{0}^{\infty} f(s) \, ds \right) \) and the norming \( a_{nh}^{-1} \) goes into the second, the random factor.

(b) Representation (3.4) gives also a motivation for the fact that the classical techniques of Davis and Resnick [12] to prove the asymptotic behavior of one-dimensional MA processes by using truncated MA processes will not work for the high-frequency case, because \( \lim_{n \to \infty} \sum_{j=0}^{\infty} f(jh_n)h_n = 0_{d+m} \) for \( M > 0 \). 

**Remark 3.3.** A straightforward extension is the convergence of the finite dimensional distribution for any \( l \in \mathbb{N} \), as \( n \to \infty \),

\[ h_n a_{nh}^{-1} \left( \sum_{k=1}^{n} V(kh_n), \ldots, \sum_{k=1}^{n} V((k+l)h_n) \right) \Rightarrow \left( \int_{0}^{\infty} f(s) \, ds \right) (S_1(1), \ldots, S_1(1)) \]

since for any \( l \in \mathbb{N}_0 \),

\[ h_n a_{nh}^{-1} \sum_{k=1}^{n} V((k+l)h_n) = \left( \sum_{j=0}^{\infty} f(jh_n)h_n \right) \left( a_{nh}^{-1} \sum_{k=1}^{n} [L_1(kh_n) - L_1((k-1)h_n)] \right) + o_p(1) \]

as in (3.4).

Next we investigate the co-integrated model (1.1)-(1.2).

**Theorem 3.4.** Let model (1.1)-(1.2) be given where \( \mathbb{X} \) has full rank and let the assumptions of Theorem 3.1 hold. Furthermore, let \( \{L_2(t)\}_{t \in \mathbb{R}} \) be an \( \mathbb{R}^r \)-valued Lévy process independent of \( \{L_1(t)\}_{t \in \mathbb{R}} \), where \( L_2(1) \in DA(\beta, b_n, \mu_2, \Sigma_2) \) and \( \mathbb{E}(L_2(1)) = 0 \), if \( \beta > 1 \). If \( \beta = 1 \) assume additionally that \( L_2(1) \) is symmetric. Set \( a_t := a_{t|} \) and \( b_t = b_{t|} \) for \( t \geq 0 \). Moreover, let \( \{S_2(t)\}_{t \geq 0} \) be an \( \mathbb{R}^r \)-valued \( \beta \)-stable Lévy process independent of \( \{S_1(t)\}_{t \geq 0} \) with characteristic triplet \( (\int_{|x|>1} x \mu_2(dx), \Sigma_2, \mu_2) \) if \( \beta \in (0, 1] \) and \( (- \int_{|x|>1} x \mu_2(dx), \Sigma_2, \mu_2) \) if \( \beta > 1 \), and suppose

\[ \mathbb{P} \left( \det \left( \int_{0}^{1} S_2(s)S_2(s)^\prime \, ds \right) = 0 \right) = 0. \]

(a) Suppose the sequence of positive constants \( \{h_n\}_{n \in \mathbb{N}} \) satisfies \( h_n \downarrow 0 \) as \( n \to \infty \) and \( \lim_{n \to \infty} nh_n = \infty \). If \( \min(\alpha, \beta) < 2 \) and either \( \nu_{S_2}(\mathbb{R}^r) = \infty \) or \( \Sigma_{\beta} \neq 0_{\mathbb{R}^r} \), we additionally assume that for some \( \varepsilon > 0 \),

\[ \lim_{n \to \infty} nh_n h_n^{-1} a_{nh}^{-1} b_{nh}^{-1} = 0 \quad \text{if} \quad \min(\alpha, \beta) \leq 1, \quad \text{and moreover,} \]

\[ \lim_{n \to \infty} h_n h_n^{-1} a_{nh}^{-1} b_{nh}^{-1} = 0 \quad \text{if} \quad 1 < \min(\alpha, \beta) < 2. \]

Then \( \hat{A}_n \) as given in (1.6) satisfies as \( n \to \infty \),

\[ nh_n a_{nh}^{-1} b_{nh}(\hat{A}_n - A) \Rightarrow \left( \int_{0}^{\infty} f(s) \, ds \right) \left( S_1(1)S_2(1)^\prime - \int_{0}^{1} S_1(s-)dS_2(s)^\prime \right) \left( \int_{0}^{1} S_2(s)S_2(s)^\prime \, ds \right)^{-1}. \]

In particular, \( \hat{A}_n \xrightarrow{p} A \) as \( n \to \infty \) if \( \alpha > \beta / (\beta + 1) \), i.e. \( \hat{A}_n \) is a consistent estimator.

(b) Let \( h > 0 \) and \( h_n = h \) for any \( n \in \mathbb{N} \). Suppose \( \mathbb{E}[|L_1(1)|]^r < \infty \) for some \( r > 2 \) if \( \alpha = 2 \). Then \( \hat{A}_n \) as given in (1.6) satisfies as \( n \to \infty \),

\[ na_n^{-1} b_n(\hat{A}_n - A) \Rightarrow \left( S_{[h]}(1)S_2(1)^\prime - \int_{0}^{1} S_{[h]}(s-)dS_2(s)^\prime \right) \left( \int_{0}^{1} S_2(s)S_2(s)^\prime \, ds \right)^{-1}. \]
In particular, $\hat{A}_n \xrightarrow{\mathcal{P}} A$ as $n \to \infty$ if $\alpha > \beta/(\beta + 1)$, i.e., $\hat{A}_n$ is a consistent estimator.

**Remark 3.5.**

(a) Assumption (3.6) can be relaxed, which goes beyond this paper because it uses a completely different approach, and can be found in Fasen [15].

(b) If $\alpha = \beta < 2$, sufficient conditions for (3.6) are that for some $\varepsilon > 0$,

$$\lim_{n \to \infty} n h_n^2 \sum_{k=1}^{n} V(kh_n) V(kh_n) \xrightarrow{\mathbb{E}} \int_0^\infty f(s) |S_1| f(s) \, ds,$$

which is equal to $\mathbb{E}(V(0) V(0)')$ if $\alpha = 2$. In particular, this means for a one-dimensional CARMA process $(V(t))_{t \geq 0}$ with $f = 1$, $L_1 = L_1$ and $S_1 = S_1$ that as $n \to \infty$,

$$h_n a_n^2 \sum_{k=1}^{n} V(kh_n)^2 \xrightarrow{\mathbb{E}} \left( \int_0^\infty f^2(s) \, ds \right) |S_1|.$$

Finally, we investigate the asymptotic behavior of the sample autocovariance. Both Theorem 3.1 and Theorem 3.6 are used in Fasen and Fuchs [17, 18] to derive the asymptotic behavior of the normalized, the self-normalized and the smoothed periodogram as well as for statistical inference of CARMA processes.

**Theorem 3.6.** Let $(V(t))_{t \geq 0}$ be an $\mathbb{R}^d$-valued MCARMA$(p, q)$ process as given in Definition 2.1 driven by the $\mathbb{R}^m$-valued Lévy process $(L_1(t))_{t \in \mathbb{R}}$ with $L_1(1) \in \mathcal{D}(\alpha, \alpha_n, \mu_1, \Sigma_1)$. Set $a_t := a_{1|t}$ for $t \geq 0$.

(a) Let $(S_1(t))_{t \geq 0}$ be an $\mathbb{R}^m$-valued $\alpha$-stable Lévy process with characteristic triplet $(\theta, \Sigma_1, \mu_1)$. Suppose the sequence of positive constants $(h_n)_{n \in \mathbb{N}}$ satisfies $h_n \downarrow 0$ as $n \to \infty$ and $\lim_{n \to \infty} n h_n = \infty$. Then as $n \to \infty$,

$$a_n^{-2} \sum_{k=1}^{n} V(kh_n)^2 \xrightarrow{\mathbb{E}} [S_1, S_1],$$

which is equal to $\mathbb{E}(|S_1|)$ if $\alpha = 2$.

(b) Let $h > 0$ and let $(S_{\ell h}(t))_{t \geq 0}$ be an $\mathbb{R}^d$-valued $\alpha$-stable Lévy process with characteristic triplet $(\theta, \Sigma_{\ell h}, \mu_{\ell h})$ where $\Sigma_{\ell h}$ and $\Sigma_{\ell h}$ are given as in (3.1) and (3.2), respectively. Then as $n \to \infty$,

$$a_n^{-2} \sum_{k=1}^{n} V(kh) V(kh) \xrightarrow{\mathbb{E}} [S_{\ell h}, S_{\ell h}],$$

which is equal to $\Sigma_{\ell h}$ if $\alpha = 2$.

Thus, if $\mathbb{E}(|L_1(1)|^2) < \infty$, the sample autocovariance is a consistent estimator. Further, we want to point out that in contrast to Theorem 3.1, Theorem 3.6 does not require $\mathbb{E}(L_1(1)) = 0_d$ if $1 < \alpha < 2$ and the symmetry of $L_1(1)$ if $\alpha = 1$. Also the drift term of $S_1$ can be chosen arbitrary since it doesn’t have an influence on $[S_1, S_1]$.

As in Remark 3.2 we shall make a comparison to the discrete-time case.

**Remark 3.7.**

Let a discrete-time MA process as in Remark 3.2 be given. Then by Davis et al. [11], Theorem 2.1, for the 2-dimensional case (see also Meerschaert and Scheffler [29], (4.7)) as $n \to \infty$,

$$a_n^{-2} \sum_{k=1}^{n} X_k X_k' \xrightarrow{\mathbb{E}} \sum_{k=0}^{\infty} C_k [S_1, S_1] C_k'.$$

Again we see the similarity between the continuous-time high frequency and the discrete-time model. Considering an $\alpha$-stable Lévy process $(L_1(t))_{t \geq 0}$ and an $\alpha$-stable random variable $\xi_1$, the normsing can be
understood in the continuous-time high-frequency model by

\[
\begin{align*}
&\tilde{h}_n a_{nh}^{-2} \sum_{k=1}^{n} V(kh_n) V(kh_n)' \\
&= \sum_{j=0}^{\infty} f(jh_n) \left( a_{nh}^{-2} \sum_{k=1}^{n} \left[ L_1(kh_n) - L_1((k-1)h_n)\right] [L_1(kh_n) - L_1((k-1)h_n)]' \right) f(jh_n)' h_n + o_P(1) \\
&= \sum_{j=0}^{d} f(jh_n)[L_1, L_1]' f(jh_n)' h_n + o_P(1) \\
&= \int_0^\infty f(s)[S_1, S_1]' f(s)' ds + o_P(1).
\end{align*}
\]

The first factor \( h_n \) of \( h_n a_{nh}^{-2} \) is required for the convergence of the integral and \( a_{nh}^{-2} \) for the random part. In the discrete-time model we have

\[
a_n^{-2} \sum_{k=1}^{n} X_k X_k' = \sum_{j=0}^{d} C_j \left( a_n^{-2} \sum_{k=1}^{n} \xi_k \xi_k' \right) C_j + o_P(1) \equiv \sum_{j=0}^{d} C_j S_1 S_1' C_j + o_P(1).
\]

\[\square\]

**Remark 3.8.** The finite dimensional distribution of the sample autocovariance function has for any \( l \in \mathbb{N} \) the asymptotic behavior as \( n \to \infty \),

\[
\begin{align*}
&h_n a_{nh}^{-2} \left( \sum_{k=1}^{n} V(kh_n) V(kh_n)', \ldots, \sum_{k=1}^{n} V(kh_n) V((k+l)h_n)' \right) \\
&\quad \Rightarrow \left( \int_0^\infty f(s)[S_1, S_1]' f(s)' ds, \ldots, \int_0^\infty f(s)[S_1, S_1]' f(s)' ds \right).
\end{align*}
\]

\[\square\]

**4. Multivariate high frequency model**

Under the following general assumption we derive the properties of the least squares estimator given in (1.6) for model (1.4)-(1.5). As mentioned in the introduction and used in the proof of Theorem 3.1, the cointegrated MCARMA model can be seen as a special case of this more general model.

**Assumption 4.1.** Let model (1.4)-(1.5) be given.

(a) Suppose that there exist sequences of positive constants \( \tilde{a}_n, \tilde{b}_n \uparrow \infty \) as \( n \to \infty \) such that

\[
\left( \tilde{a}_n^{-1} \sum_{k=1}^{\lfloor n \rfloor} \tilde{g}_{n,k}^\prime, \tilde{b}_n^{-1} \sum_{k=1}^{\lfloor n \rfloor} \tilde{e}_{n,k} \right)_{i \geq 0} \Rightarrow (S_1(t)', S_2(t)')_{t \geq 0} \quad \text{as } n \to \infty \quad \text{in } \mathbb{D}([0,1], \mathbb{R}^{m+1}), \quad (4.1)
\]

where \( S_1 = (S_1(t))_{t \geq 0} \) is a càdlàg stochastic process in \( \mathbb{R}^m \) and \( S_2 = (S_2(t))_{t \geq 0} \) is a càdlàg stochastic process in \( \mathbb{R}^n \), respectively. Furthermore, suppose that

\[
P \left( \det \left( \int_0^1 S_2(s) S_2(s)' ds \right) = 0 \right) = 0. \quad (4.2)
\]

(b) Define

\[\tilde{Z}_{n,k} := \sum_{j=0}^{\infty} \left( \sum_{l=j+1}^{\infty} C_{n,l} \right) \xi_{n,k-j} \quad \text{for } k \in \mathbb{N}_0, n \in \mathbb{N}.\]
Suppose that there exist a sequence of positive constants \((h_n)_{n \in \mathbb{N}}\) and a positive bounded decreasing function \(g\) with either \(g \in \mathcal{C}_{-\alpha}\), \(\alpha \in (0, 2)\), or \(\int_0^\infty xg(x)\,dx < \infty\) and \(\alpha := 2\), such that
\[
P(h_n\|\tilde{Z}_{n,0}) > x) \leq g(x) \quad \text{for } x \geq 0, n \in \mathbb{N}.
\]
(c) Let for some \(0 < \theta < \alpha\) and \(\theta \leq 1\),
\[
\sum_{k=0}^{\infty} k\|\mathbf{C}_{n,k}\|^\theta < \infty.
\]
Furthermore, there exists a matrix \(\mathbf{C} \in \mathbb{M}_{d \times m}(\mathbb{R})\) for \((h_n)_{n \in \mathbb{N}}\) in (b) such that
\[
\lim_{n \to \infty} h_n\sum_{k=0}^{\infty} \mathbf{C}_{n,k} = \mathbf{C}.
\]
(d) There exist constants \(K_1, K_2, K_3 < \infty\) and some \(0 < \delta < \alpha\) with \(\delta \leq 1\) such that the following holds:
(i) \(n\delta^{-1}E(\|e_{n,1}\|^2 1_{\{e_{n,1} \leq \tilde{b}_n\}}) \leq K_1 \forall n \in \mathbb{N}\).
(ii) \(n\delta^{-1}E(\|e_{n,1}\|^2 1_{\{e_{n,1} \leq \tilde{b}_n\}}) \leq K_2 \forall n \in \mathbb{N}\).
(iii) \(n\delta^{-1}E(\|e_{n,1}\|^2 1_{\{e_{n,1} > \tilde{b}_n\}}) \leq K_3 \forall n \in \mathbb{N}\).
Furthermore, one of the following conditions is satisfied for \(g\) in (b):
(iv) \(g \in \mathcal{C}_{-\alpha}\) with \(\alpha \in (0, 2)\) and \(\lim_{n \to \infty} n\tilde{a}_n^{-\alpha} \tilde{b}_n^{-1}E\|e_{n,1}\|^\alpha = 0\).
(iv) \(\int_0^\infty xg(x)\,dx < \infty\) and \(\lim_{n \to \infty} n\tilde{a}_n^{-\alpha} \tilde{b}_n^{-1}E\|e_{n,1}\|^\alpha = 0\).

Note that if \(g\) is a positive bounded decreasing function with \(g \in \mathcal{C}_{-\alpha}\), \(\alpha \in (0, 2)\) then \(\int_0^\infty x^{\alpha-1}g(x)\,dx < \infty\) for any \(0 < \gamma < \alpha\) (apply Karamata’s Theorem (cf. Resnick [40], Theorem 2.1)). Moreover, \(\lim_{n \to \infty} g(a_n) = 0\).

We start with the first limit result.

**Theorem 4.2.** Let model (1.4)-(1.5) be given where \(\mathcal{X}_n\) has full rank and let Assumption 4.1 hold. Define
\[
\mathbf{S}_{1,n}(t) := h_n\tilde{a}_n^{-1}\sum_{k=1}^{[m]} \mathbf{Z}_{n,k} \quad \text{and} \quad \mathbf{S}_{2,n}(t) := \tilde{b}_n^{-1}\sum_{k=1}^{[m]} \mathbf{e}_{n,k} \quad \text{for } t \geq 0, n \in \mathbb{N}.
\]
Then as \(n \to \infty\),
\[
\left(\mathbf{S}_{1,n}(1), \mathbf{S}_{2,n}(1), \int_0^1 \mathbf{S}_{2,n}(s)\mathbf{S}_{2,n}(s)\,ds, \int_0^1 \mathbf{S}_{1,n}(s)\,d\mathbf{S}_{2,n}(s)\right) \quad \Rightarrow \quad \left(\mathbf{CS}_{1}(1), \mathbf{S}_{2}(1), \int_0^1 \mathbf{S}_{2}(s)\mathbf{S}_{2}(s)\,ds, \mathbf{C} \int_0^1 \mathbf{S}_{1}(s)\,d\mathbf{S}_{2}(s)\right)
\]
in \(\mathbb{R}^d \times \mathbb{R}^y \times \mathbb{R}^{y \times y} \times \mathbb{R}^{d \times y}\).

Based on this theorem we are able to derive the asymptotic behavior of the least squares estimator in the cointegrated model.

**Theorem 4.3.** Let model (1.4)-(1.5) be given and let Assumption 4.1 hold. Then \(\hat{\mathbf{A}}_n\) as given in (1.6) satisfies as \(n \to \infty\),
\[
nh_n\tilde{a}_n^{-1}\tilde{b}_n(\hat{\mathbf{A}}_n - \mathbf{A}) \quad \Rightarrow \quad \mathbf{C} \left(\mathbf{S}_{1}(1)\mathbf{S}_{2}(1)' - \int_0^1 \mathbf{S}_{1}(s)\,d\mathbf{S}_{2}(s)\right) \left(\int_0^1 \mathbf{S}_{2}(s)\mathbf{S}_{2}(s)'\,ds\right)^{-1}.
\]
In particular, \(\hat{\mathbf{A}}_n \xrightarrow{p} \mathbf{A}\) as \(n \to \infty\) if \(\lim_{n \to \infty} nh_n\tilde{a}_n^{-1}\tilde{b}_n = \infty\), i.e. \(\hat{\mathbf{A}}_n\) is a consistent estimator.
5. Proofs

5.1. Proofs of Section 4

The proofs of this section are very similar to Fasen [16]. However, we mimic them to show where the different assumptions are going in. An essential piece of the proof will be that as \( n \to \infty \),

\[
h_n \tilde{a}_n^{-1} \sum_{k=1}^{n} Z_{n,k} = \left( h_n \sum_{j=0}^{\infty} C_{n,j} \right) \left( \tilde{a}_n^{-1} \sum_{k=1}^{n} \tilde{\varepsilon}_{n,k} \right) + o_p(1). \tag{5.1}
\]

As Lemma 5.6 in Fasen [16] we can prove the next lemma. This lemma we require for the proof of Theorem 3.6 and Theorem 4.2.

**Lemma 5.1.** Let \((\varepsilon_{n,k})_{k \in \mathbb{N}}\) be an iid sequence of random vectors in \( \mathbb{R}^s \) for any \( n \in \mathbb{N} \), and let \((W_{n,k})_{k \in \mathbb{N}}\) be a sequence of random vectors in \( \mathbb{R}^d \) for any \( n \in \mathbb{N} \), where \((W_{n,k-j})_{j=1, \ldots, k-1}\) is independent of \((\varepsilon_{n,k+j})_{j \in \mathbb{N}}\) for any \( n, k \in \mathbb{N} \). Suppose that there exists a positive, bounded, decreasing function \( g \) such that

\[
\mathbb{P}(\|W_{n,k}\| > x) \leq g(x) \quad \text{for any } x \geq 0, n \in \mathbb{N}, k \in \mathbb{N}.
\]

Assume that one of the following conditions is satisfied:

1. \( g \in \mathcal{R}_-, 0 < \alpha < 2, \text{ and for some } 0 < \delta \leq 1, \delta < \alpha, \text{ the condition } \lim_{n \to \infty} n \tilde{a}_n^{-\delta} \tilde{b}_n^{-\delta} \mathbb{E}\|\varepsilon_{n,1}\|^\delta = 0 \text{ holds.}
2. \[ \int_0^x g(x) \, dx < \infty, \quad \mathbb{E}(\varepsilon_{n,1}) = 0, \quad \text{for } n \in \mathbb{N} \text{ and } \lim_{n \to \infty} n \tilde{a}_n^{-\delta} \tilde{b}_n^{-\delta} \mathbb{E}\|\varepsilon_{n,1}\|^2 = 0. \]

Then as \( n \to \infty \),

\[
\tilde{a}_n^{-1} \tilde{b}_n^{-1} \sum_{k=1}^{n} W_{n,k-1} \varepsilon_{n,k} \xrightarrow{p} 0_{d \times v}.
\]

**Proof.** Case (1). Taking \( \delta \leq 1 \) into account we have

\[
\tilde{a}_n^{-\delta} \tilde{b}_n^{-\delta} \left\| \sum_{k=1}^{n} W_{n,k-1} \varepsilon_{n,k} \right\|^\delta \leq \tilde{a}_n^{-\delta} \tilde{b}_n^{-\delta} \sum_{k=1}^{n} \mathbb{E}\|W_{n,k-1}\| \mathbb{E}\|\varepsilon_{n,k}\|^\delta
\]

\[
\leq n \tilde{a}_n^{-\delta} \tilde{b}_n^{-\delta} \left( \delta \int_0^x g(x) \, dx \right) \mathbb{E}\|\varepsilon_{n,1}\|^\delta n \xrightarrow{p} 0.
\]

Case (2). We investigate the sequence of random matrices componentwise and denote by \((l,m)\) the component in the \( l \)-th row and \( m \)-th column. Since \((W_{n,k-1} \varepsilon_{n,k})_{(l,m)}\) are uncorrelated,

\[
\tilde{a}_n^{-2} \tilde{b}_n^{-2} \mathbb{E} \left( \left( \sum_{k=1}^{n} W_{n,k-1} \varepsilon_{n,k} \right) \right)^2_{(l,m)} = \tilde{a}_n^{-2} \tilde{b}_n^{-2} \sum_{k=1}^{n} \mathbb{E} \left( (W_{n,k-1} \varepsilon_{n,k}) \right)_{(l,m)}^2
\]

\[
\leq C_1 \tilde{a}_n^{-2} \tilde{b}_n^{-2} \sum_{k=1}^{n} \mathbb{E}\|W_{n,k-1}\|^2 \mathbb{E}\|\varepsilon_{n,k}\|^2
\]

\[
\leq C_2 n \tilde{a}_n^{-2} \tilde{b}_n^{-2} \mathbb{E}\|\varepsilon_{n,1}\|^2.
\]

The last expression tends to 0 as \( n \to \infty \) by assumption.

We will prove Theorem 4.2 by an application of Jacod and Shiryaev [23], Theorem VI.6.22. Therefore, we need some definition.

**Definition 5.2.** Let \( S^n = (S^n(t))_{t \geq 0} = (S^n(t), \ldots, S^n(t))_{t \geq 0} \) for any \( n \in \mathbb{N} \) be an \( \mathbb{R}^{m \times r} \)-valued adapted càdlàg stochastic process on \((\Omega, \mathcal{F}, ((\mathcal{F}_t^n)_{t \geq 0})_{n \in \mathbb{N}}, \mathbb{P})\) and \( \mathcal{H}^m \) be the set of all \((\mathcal{F}_t^n)_{t \geq 0}\) predictable pro-
sequences $H^n$ in $\mathbb{R}^{d \times m}$ having the form

$$H^n_t = Y^n_0 \mathbf{1}_{[0]} + \sum_{k=1}^{m(H^n)} Y^n_k \mathbf{1}_{(t_{k+1}^n, t_k^n]}(t) \quad \text{for } t \geq 0$$

with $m(H^n) \in \mathbb{N}$, $0 = t_0^n < \ldots < t_{m(H^n)+1}^n < \infty$, and $Y^n_k$ in $\mathbb{R}^{d \times m}$ is $\mathcal{F}_{t_k^n}$-measurable with $\|Y^n_k\| \leq 1$. Then the sequence of stochastic processes $(S^n_t)_{n \in \mathbb{N}}$ is said to be predictably uniformly tight (P-UT) if for any $t > 0$:

$$\lim_{n \to \infty} \sup_{H^n \in \mathcal{H}^n} \mathbb{P} \left( \left\| \sum_{k=1}^{m(H^n)} Y^n_k (S^n_{t+1} \wedge t) - S^n_t \right\| > x \right) = 0.$$

Similarly to Lemma 5.5 in Fasen [16] we derive the next Lemma.

**Lemma 5.3.** Let Assumptions 4.1 (d) hold. Then the sequence of stochastic processes $(S^n_{t})_{n \in \mathbb{N}}$ as given in Theorem 4.2 is P-UT on $(\Omega, \mathcal{F}, ((\mathcal{F}_t^n)_{t \geq 0})_{n \in \mathbb{N}}, \mathbb{P})$ with $\mathcal{F}_t^n = \sigma(\varepsilon_{n,k} : k \leq [nt]), t \geq 0, n \in \mathbb{N}$.

**Proof.** We define for $t \geq 0, n \in \mathbb{N}$,

$$M_n(t) := \bar{b}_n^{-1} \sum_{k=1}^{[nt]} \left( \varepsilon_{n,k} \mathbf{1}_{\{[\varepsilon_{n,k}] \leq \bar{b}_n\}} - \mathbb{E}(\varepsilon_{n,1} \mathbf{1}_{\{[\varepsilon_{n,1}] \leq \bar{b}_n\}}) \right),$$

$$D_n^{(1)}(t) := [nt] \bar{b}_n^{-1} \mathbb{E}(\varepsilon_{n,1} \mathbf{1}_{\{[\varepsilon_{n,1}] \leq \bar{b}_n\}}),$$

$$D_n^{(2)}(t) := \bar{b}_n^{-1} \sum_{k=1}^{[nt]} \varepsilon_{n,k} \mathbf{1}_{\{[\varepsilon_{n,k}] > \bar{b}_n\}}.$$

It is obvious that $(M_n(t))_{t \geq 0}$ is a martingale with respect to $(\mathcal{F}_t^n)_{t \geq 0}$ and in particular, a local martingale. All three processes are adapted with respect to $(\mathcal{F}_t^n)_{t \geq 0}$ and we have the semimartingale decomposition

$$S_{2,n}(t) = M_n(t) + D_n^{(1)}(t) + D_n^{(2)}(t).$$

If $(M_n)_{n \in \mathbb{N}}, (D_n^{(1)})_{n \in \mathbb{N}}$ and $(D_n^{(2)})_{n \in \mathbb{N}}$ are P-UT then VI.6.4 in Jacod and Shiryaev [23] gives that the sum $(S_{2,n})_{n \in \mathbb{N}}$ is P-UT as well.

Let $VT_t(W) = \sup_{s \geq 0} VT_s(W_i)$ for $s \geq 0$ denote the variation process of the càdlàg stochastic process $(W(s))_{s \geq 0} = (W_1(s), \ldots, W_d(s))_{s \geq 0}$. To prove the P-UTness of $(D_n^{(1)})_{n \in \mathbb{N}}$ and $(D_n^{(2)})_{n \in \mathbb{N}}$ it is sufficient to show that $(VT_t(D_n^{(1)}))_{n \in \mathbb{N}}$ and $(VT_t(D_n^{(2)}))_{n \in \mathbb{N}}$ are tight for any $t \geq 0$; see Jacod and Shiryaev [23], VI.6.6. Let $t \geq 0$ be fixed. We start with the verification of the tightness of $(VT_t(D_n^{(1)}))_{n \in \mathbb{N}}$ by showing that it is uniformly bounded. Assumption 4.1 (d) (ii) gives the uniform bound

$$\sup_{n \in \mathbb{N}} VT_t(D_n^{(1)}) \leq C_1 \sup_{n \in \mathbb{N}} \bar{b}_n^{-1} \mathbb{E}(\varepsilon_{n,1} \mathbf{1}_{\{[\varepsilon_{n,1}] \leq \bar{b}_n\}}) \leq C_2 t,$$

which results in the tightness of $(VT_t(D_n^{(1)}))_{n \in \mathbb{N}}$.

For the tightness of $(VT_t(D_n^{(2)}))_{n \in \mathbb{N}}$ we use that for $\delta \leq 1$,

$$(VT_t(D_n^{(2)}))^{\delta} \leq C_3 \bar{b}_n^{-\delta} \sum_{k=1}^{[nt]} E(\|\varepsilon_{n,k}\|^{\delta} \mathbf{1}_{\{[\varepsilon_{n,k}] > \bar{b}_n\}}).$$

Then a conclusion of Assumption 4.1 (d)(iii) and Markov’s inequality is

$$\sup_{n \in \mathbb{N}} \mathbb{P}(VT_t(D_n^{(2)}) > \eta) \leq C_4 \eta^{-\delta} \sup_{n \in \mathbb{N}} \bar{b}_n^{-\delta} \sum_{k=1}^{[nt]} E(\|\varepsilon_{n,k}\|^{\delta} \mathbf{1}_{\{[\varepsilon_{n,k}] > \bar{b}_n\}}) \leq C_5 \eta^{-\delta} \eta^{0 \to \infty} = 0.$$

12
Hence, \((V^T(D_n^{(2)}))_{n \in \mathbb{N}}\) is also tight.

If we show that \((\{\mathbf{M}_n, \mathbf{M}_n\}'\}_{n \in \mathbb{N}}\) is tight for any \(t \geq 0\), then the \(P\text{-UT}\)ness of \((\mathbf{M}_n)_{n \in \mathbb{N}}\) follows by Jacod and Shiryaev [23], Proposition VI.6.13. Here, we use Assumption 4.1 (d) (i) for

\[
\sup_{n \in \mathbb{N}} \mathbb{P}(\|\mathbf{M}_n, \mathbf{M}_n\| > \eta) \leq \eta^{-1} \sup_{n \in \mathbb{N}} n^{2} \mathbb{E}(\|e_{n,1}\|^2) \leq \mathcal{C}_0 \eta^{-1} \rightarrow 0 \quad \text{as} \quad \eta \to \infty.
\]

Finally, \((\{\mathbf{M}_n, \mathbf{M}_n\}'\}_{n \in \mathbb{N}}\) is tight as well.

\[\square\]

**Proof of Theorem 4.2.** The Beveridge-Nelson decomposition (cf. [4]) has the representation

\[
Z_{n,k} = \left( \sum_{j=0}^{\infty} C_{n,j} \right) \xi_{n,k} + \tilde{Z}_{n,k-1} - \tilde{Z}_{n,k} \quad \text{for} \quad k, n \in \mathbb{N}.
\]

Thus,

\[
S_{1,n}(t) = h_n \tilde{a}^{-1} \left( \sum_{j=0}^{\infty} C_{n,j} \right) \xi_{n,k} + h_n \tilde{a}^{-1} \left[ \tilde{Z}_{n,0} - \tilde{Z}_{n,1} \right] \quad \text{for} \quad t \geq 0.
\] (5.4)

Therefore we define

\[
\tilde{S}_{1,n}(t) := \left( \sum_{j=0}^{\infty} C_{n,j} \right) \tilde{a}^{-1} \sum_{k=1}^{\infty} \xi_{n,k} \quad \text{for} \quad t \geq 0.
\] (5.5)

By Assumption 4.1 (a) and (c) we have as \(n \to \infty\),

\[
\left( \tilde{S}_{1,n}(t), \tilde{S}_{2,n}(t) \right)_{t \geq 0} \Rightarrow \left( (CS_1(t))', (CS_2(t))' \right)_{t \geq 0} \quad \text{in} \quad D([0,1], \mathbb{R}^{d\times v}).
\]

A straightforward conclusion of the continuous mapping theorem is then as \(n \to \infty\),

\[
\left( \tilde{S}_{1,n}(1), \tilde{S}_{2,n}(1), \int_0^1 S_{2,n}(s)S_{2,n}(s) ds, \left( \tilde{S}_{1,n}(t)', \tilde{S}_{2,n}(t)' \right)_{t \geq 0} \right)
\]

\[
\Rightarrow \left( \text{CS}_1(1), \text{CS}_2(1), \int_0^1 S_2(s)S_2(s) ds, \left( (CS_1(t))', (CS_2(t))' \right)_{t \geq 0} \right)
\]

in \(\mathbb{R}^d \times \mathbb{R}^v \times \mathbb{R}^{d\times v} \times \mathbb{R}^{d\times v} \). Since \((S_{2,n})_{n \in \mathbb{N}}\) is \(P\text{-UT}\) by Lemma 5.3, a result of Jacod and Shiryaev [23], Theorem VI.6.22, is that as \(n \to \infty\),

\[
\left( \tilde{S}_{1,n}(1), \tilde{S}_{2,n}(1), \int_0^1 S_{2,n}(s)S_{2,n}(s) ds, \int_0^1 \tilde{S}_{1,n}(s) ds\tilde{S}_2(s) \right)
\]

\[
\Rightarrow \left( \text{CS}_1(1), \text{CS}_2(1), \int_0^1 S_2(s)S_2(s) ds, \text{C} \int_0^1 S_1(s) ds\tilde{S}_2(s) \right)
\] (5.6)

in \(\mathbb{R}^d \times \mathbb{R}^v \times \mathbb{R}^{d\times v} \times \mathbb{R}^{d\times v}\).

On the one hand, by (5.4) we have

\[
\int_0^1 S_{1,n}(s) ds\tilde{S}_2(s) = \int_0^1 S_{1,n}(s) ds\tilde{S}_2(s) + \left[ h_n \tilde{a}_n^{-1} \tilde{Z}_{n,0}S_{2,n}(1) - h_n \tilde{a}_n^{-1} \tilde{b}_n^{-1} \sum_{k=1}^{n} \tilde{Z}_{n,k-1} e_{n,k} \right].
\] (5.7)

Applying Lemma 5.1, \(h_n \tilde{a}_n^{-1} \tilde{Z}_{n,0} \to 0_d\) as \(n \to \infty\) (by Assumption 4.1 (b)), and \(S_{2,n}(1) \Rightarrow S_2(1)\) as \(n \to \infty\) gives on the other hand,

\[
h_n \tilde{a}_n^{-1} \tilde{b}_n^{-1} \tilde{Z}_{n,0}S_{2,n}(1) - h_n \tilde{a}_n^{-1} \tilde{b}_n^{-1} \sum_{k=1}^{n} \tilde{Z}_{n,k-1} e_{n,k} \to 0_{d\times v}\] as \(n \to \infty\).
Finally, from (5.6)-(5.8) the statement follows.

Proof of Theorem 4.3. (a) Since \( Y_n = AX_n + Z_n \) with \( X_n, Y_n \) as given in (1.5) and \( Z_n = (Z_{n,1}, \ldots, Z_{n,n}) \), we have

\[
\tilde{A}_n = A + Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} - \tilde{A}_n = Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} - A.
\]

(5.9)

This gives

\[
h_n \tilde{a}_n^{-1} \tilde{b}_n \left( \tilde{A}_n - A \right) = n h_n \tilde{a}_n^{-1} \tilde{b}_n (Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} - A) = \left( n h_n \tilde{a}_n^{-1} Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} \right) \left( n h_n \tilde{a}_n^{-1} Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} \right)^{-1}.
\]

(5.10)

Now we will prove the convergence

\[
\left( n h_n \tilde{a}_n^{-1} Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} \right) \implies \left( CS_1(1) S_2(1)' - C \int_0^1 S_1(s-\cdot) dS_2(s)' \int_0^1 S_2(s) S_2(s)' ds \right)
\]

in \( \mathbb{R}^{d \times d} \times \mathbb{R}^{d \times d} \) as \( n \to \infty \), giving us the claim by a continuous mapping theorem, since (4.2) holds. We get for the left-hand side of (5.11),

\[
h_n \tilde{a}_n^{-1} \tilde{b}_n^{-1} Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} = S_{1,n}(1) S_{2,n}(1)' - \int_0^1 S_{1,n}(s-\cdot) dS_{2,n}(s)', \quad (5.12)
\]

\[
n^{-1} \tilde{b}_n^{-2} Z_n(\tilde{X}_n^T \tilde{X}_n)^{-1} = \int_0^1 S_{2,n}(s) S_{2,n}(s)' ds. \quad (5.13)
\]

The result follows then from Theorem 4.2 and (5.10)-(5.13).

5.2. Proof of Theorem 3.1

It is well known that the stationary Ornstein-Uhlenbeck process \( Z \) given in (2.4) observed at the time-grid \( h_n Z \) has the representation as a MA process

\[
Z(kh_n) = \sum_{j=0}^{\infty} e^{-A_{kh_n} j} \xi_{n,k-j} \quad \text{for } k \in \mathbb{Z},
\]

where

\[
\xi_{n,k} = \int_{(k-1)h_n}^{kh_n} e^{-A_{kh_n} x} B dL_1(s) \quad \text{for } k \in \mathbb{Z}, n \in \mathbb{N}.
\]

As (5.1) suggests as \( n \to \infty \),

\[
h_n a_{n}^{-1} \sum_{k=1}^{n} V(kh_n) = \left( h_n \sum_{j=0}^{\infty} e^{-A_{kh_n} j} \right) \left( a_{n}^{-1} \sum_{k=1}^{n} \xi_{n,k} \right) + o_p(1).
\]

The convergence of \( a_{n}^{-1} \sum_{k=1}^{n} \xi_{n,k} \) is based on central limit results for arrays and the properties of the sequence of iid random vectors \( \{ \xi_{n,k} \}_{k \in \mathbb{Z}} \) as presented in Appendix A.

Before we state the proof of Theorem 3.1, we present the analogous result for the state process \( Z \) which is essential for the proof of Theorem 3.1.

Lemma 5.4. Let the assumptions of Theorem 3.1 hold. Then as \( n \to \infty \),

\[
h_n a_{n}^{-1} \sum_{k=1}^{n} Z(kh_n) \implies \Lambda^{-1} BS_1(1).
\]
Proof. First, we define \( \tilde{\alpha}_n := a_{nh_a}, \ C_{n,k} := e^{-\Lambda h_a k} \) and

\[
\xi_{n,k} := \int_{(k-1)h_n}^{kh_n} e^{-\Lambda (kh_a - s)} BdL_1(s) \quad \text{for} \ k \in \mathbb{Z}, n \in \mathbb{N}.
\]

Then

\[
Z_{n,k} := Z(kh_n) = \sum_{j=0}^{\infty} C_{n,j} \xi_{n,k-j} \quad \text{for} \ k \in \mathbb{Z}, n \in \mathbb{N}.
\]

We will show that Assumption 4.1 (a)-(d) with \( \epsilon_{n,k} := 0 \) are satisfied because then the result follows by Theorem 4.2 (it does not matter that (4.2) is not satisfied for \( \epsilon_{n,k} = 0 \)).

(a) Consider the case \( 0 < \alpha < 2 \). By Proposition A.2 (a,c,d), \( E(\xi_{n,0}) = 0 \) if \( \alpha > 1 \), \( \xi_{n,0} \) symmetric for \( \alpha = 1 \), and Resnick [40], Theorem 7.1, we have

\[
\left( \tilde{\alpha}_n^{-1} \sum_{k=1}^{\infty} \xi_{n,k} \right)_{t \geq 0} \implies (BS_1(t))_{t \geq 0} \quad \text{as} \ n \to \infty \text{ in } D([0,1], \mathbb{R}^d). \tag{5.14}
\]

Consider \( \alpha = 2 \). Then Proposition A.1 (c,e,f,g) and Kallenberg [25], Corollary 15.16 give (5.14).

(b) Since

\[
\tilde{Z}_{n,k} = \sum_{j=0}^{\infty} \left( \sum_{l=1}^{\infty} \right) e^{-\Lambda h_a l} \xi_{n,k-j} = (I_{d \times d} - e^{-\Lambda h_a})^{-1} e^{-\Lambda h_a} Z(kh_n),
\]

the inequality

\[
\mathbb{P}(h_n||Z_n,0|| > x) \leq \mathbb{P}(2||\Lambda^{-1}|||Z(0)|| > x) =: g(x) \quad \text{for} \ x \geq 0
\]

holds, where for \( \alpha < 2 \) the function \( g \in \mathcal{D}_{-\alpha} \) due to Moser and Stelzer [30], Theorem 3.2, such that by Karamata’s Theorem \( \int_0^\infty x^{\gamma-1} g(x) \, dx < \infty \) for any \( 0 < \gamma < \alpha \), and for \( \alpha = 2 \) we have

\[
2 \int_0^\infty x g(x) \, dx = 8 ||\Lambda^{-1}||^2 ||Z(0)||^2 < \infty.
\]

(c) We have \( \sum_{k=0}^{\infty} k e^{-\Lambda h_a k} \|\theta \leq \sum_{k=0}^{\infty} k e^{-\lambda \theta h_a k} < \infty \) for any \( \theta > 0 \), \( n \in \mathbb{N} \), and

\[
\lim_{n \to \infty} h_n = \lim_{n \to \infty} h_n (I_{d \times d} - e^{-\Lambda h_a})^{-1} = \Lambda^{-1}.
\]

(d) is obviously satisfied since \( \epsilon_{n,k} = 0 \). \( \Box \)

Proof of Theorem 3.1.

(a) Due to Lemma 5.4,

\[
h_n a_{nh_a}^{-1} \sum_{k=1}^{n} Z(kh_n) \implies \Lambda^{-1} BS_1(1) \quad \text{as} \ n \to \infty,
\]

and by (2.3)

\[
h_n a_{nh_a}^{-1} \sum_{k=1}^{n} V(kh_n) = h_n a_{nh_a}^{-1} \sum_{k=1}^{n} EZ(kh_n) \implies E\Lambda^{-1} BS_1(1) = \left( \int_0^\infty f(s) \, ds \right) S_1(1) \quad \text{as} \ n \to \infty,
\]

such that we receive the statement.

(b) Define \( g(s) := e^{-\Lambda s} B_{1,0}(s) \). A conclusion of Fasen [16], Proposition 2.1, is that as \( n \to \infty \),

\[
a_n^{-1} \sum_{k=1}^{n} Z(kh) \implies S_{g,h}(1).
\]
Thus, as \( n \to \infty \),

\[
\alpha_n^{-1} \sum_{k=1}^{n} V(kh) \Longrightarrow \mathbb{E}S_{g,h} \overset{d}{=} S_{f,h}(1)
\]

completes the proof. \( \square \)

5.3. Proof of Theorem 3.4

Again we use for the proof of Theorem 3.4 the similar result for the state process \( Z \) as stated in

Lemma 5.5. Let model (1.1)-(1.2) be given with \( V = Z \) and \( A \in \mathbb{R}^{pd \times v} \), and let the assumptions of Theorem 3.4 hold. Then \( A_n \) as given in (1.6) satisfies as \( n \to \infty \),

\[
\alpha_n a_{nhn}^{-1} b_{nhn}(\hat{A}_n - A) \implies \Lambda^{-1} B \left( S_1(1)S_2(1)' - \int_0^1 S_1(s-)dS_2(s)' \right) \left( \int_0^1 S_2(s)S_2(s)'ds \right)^{-1}
\]

In particular, \( \hat{A}_n \xrightarrow{p} A \) as \( n \to \infty \) if \( \alpha > \beta / (\beta + 1) \), i.e. \( \hat{A}_n \) is a consistent estimator.

**Proof.** We use the same notation as in the proof of Lemma 5.4 only that we define \( \hat{b}_n := b_{nhn} \), and

\[
\epsilon_n \equiv L_2(hh_n) - L_2((k-1)h_n).
\]

Again we will show that Assumption 4.1 (a)-(d) are satisfied following then the statement by Theorem 4.3.

(a) If \( \alpha < 2 \) due to the independence of \( (\xi_{n,k}) \) and \( (\epsilon_{n,k}) \), Proposition A.2 and Resnick [40], Theorem 7.1, the limit result

\[
\left( \frac{1}{n} \sum_{k=1}^{nt} \xi_{n,k} + h_n^{-1} \sum_{k=1}^{nt} \epsilon_{n,k} \right) \implies (S_1(t)', S_2(t)')_{t \geq 0} \quad \text{as} \quad n \to \infty \quad \text{in} \quad \mathbb{D}([0,1], \mathbb{R}^{pd+v})
\]

holds; see also Paulauskas and Rachev [31]. If \( \alpha = 2 \), (5.15) is a conclusion of Proposition A.1 and Kallen- berg [25], Corollary 15.15.

(b,c) is satisfied by the proof of Lemma 5.4.

(d) (i) is a conclusion from Proposition A.2 (c) and Proposition A.1 (e), respectively. (ii) follows from Proposition A.2 (e) and Proposition A.1 (f), respectively. Only for \( \alpha = 1 \) it follows by symmetry. Moreover, we obtain (iii) by Proposition A.2 (d) and Proposition A.1 (d).

Let \( \min(\alpha, \beta) < 2 \), then using \( \mathbb{E}\|L_2(h_n)\|^2 \leq C_1 h_n^{\beta/2} + C_2 h_n \) and (3.6) follows (iv1). In the case of a compound Poisson process, Lemma A.4 says that \( \mathbb{E}\|L_2(h_n)\|^2 \leq C_2 h_n \), such that no additional assumption is necessary. Finally, if \( \alpha = \beta = 2 \), then \( \lim_{n \to \infty} n(nh_n)^{-2} \mathbb{E}\|L_2(h_n)\|^2 = \lim_{n \to \infty} n(nh_n)^{-2} h_n \mathbb{E}\|L_2(1)\|^2 = 0 \), such that (iv2) holds. \( \square \)

**Proof of Theorem 3.4.** The proof goes as the proof of Theorem 3.1 using only Lemma 5.5 and Fasen [16], Theorem 3.4. \( \square \)

5.4. Proof of Theorem 3.6

The main idea of the proof is to show that as \( n \to \infty \),

\[
h_n a_{nhn}^{-2} \sum_{k=1}^{n} V(kh_n)V(kh_n)' = \mathbb{E} \sum_{j=0}^{\infty} e^{-N_{h_n}} \left( a_{nhn}^{-2} \sum_{k=1}^{n} \xi_{n,k} \xi_{n,k}' \right) e^{-N_{h_n}} \hat{b}_n + o_p(1).
\]

The convergence of \( a_{nhn}^{-2} \sum_{k=1}^{n} \xi_{n,k} \xi_{n,k}' \) follows by the limit results of Resnick [40], Theorem 7.1 as well, respectively by the law of large numbers for arrays of independent random vectors and the properties of
\((\xi_{n,k})_{k\in \mathbb{Z}}\) as given in Appendix A.

In the same spirit as before we start with the result for \(Z\).

Lemma 5.6. Let the assumptions of Theorem 3.6 hold. Then as \(n \to \infty\),
\[
h_n a_{nh_n}^2 \sum_{k=1}^{n} Z(kh_n)Z(kh_n)' \to \int_0^\infty e^{-\lambda s} [BS_1, BS_1] e^{-\lambda N_s} ds.
\] (5.16)

Proof. A multivariate version of the second order Beveridge-Nelson decomposition given in Phillips and Solo [34], Equation (28), gives the representation
\[
Z(kh_n)Z(kh_n)' = \sum_{j=0}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} + \sum_{r=1}^{\infty} \left( F^{(1)}_{n,k} - F^{(1)}_{n,k} \right) \sum_{r=1}^{\infty} \left( F^{(2)}_{n,k} + F^{(2)}_{n,k} \right) + \sum_{r=1}^{\infty} \left( F^{(3)}_{n,k} - F^{(3)}_{n,k} \right),
\]
where
\[
F^{(1)}_{n,k} = \sum_{j=0}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} + \sum_{r=1}^{\infty} \left( F^{(1)}_{n,k} - F^{(1)}_{n,k} \right) \sum_{r=1}^{\infty} \left( F^{(2)}_{n,k} + F^{(2)}_{n,k} \right) + \sum_{r=1}^{\infty} \left( F^{(3)}_{n,k} - F^{(3)}_{n,k} \right),
\]
Then
\[
\sum_{k=1}^{n} Z(kh_n)Z(kh_n)' = \sum_{j=0}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} + \sum_{r=1}^{\infty} \left( F^{(1)}_{n,k} - F^{(1)}_{n,k} \right) \sum_{r=1}^{\infty} \left( F^{(2)}_{n,k} + F^{(2)}_{n,k} \right) + \sum_{r=1}^{\infty} \left( F^{(3)}_{n,k} - F^{(3)}_{n,k} \right),
\] (5.17)

Step 1. Let \(\alpha \in (0, 2)\) and assume that \(L_1\) is a compound Poisson process as given in (A.5) with characteristic triplet \((\theta_n, 0_{n,m}, \nu_{n,m})\). On the one hand, by Lemma 5.7 from below we have for \(i = 2, 3, 4\)
\[
h_n a_{nh_n}^2 \sum_{i=1}^{n} Z(kh_n)Z(kh_n)' \to 0_{pd \times pd} \quad \text{as} \quad n \to \infty.
\] (5.18)

On the other hand, by Proposition A.2 (a,c) and Resnick [40], Theorem 7.1, we have
\[
S_n := a_{nh_n}^2 \sum_{k=1}^{n} \xi_{n,k} \xi_{n,k}' = [BS_1, BS_1] \quad \text{as} \quad n \to \infty.
\]

We denote by \(g_n\) and \(g\) maps from \(M_{pd \times pd}(\mathbb{R}) \to M_{pd \times pd}(\mathbb{R})\) with
\[
g_n(C) = h_n \sum_{j=0}^{\infty} e^{-\lambda h_n j} \sum_{k=1}^{\infty} e^{-\lambda h_n j} + \sum_{r=1}^{\infty} \left( F^{(1)}_{n,k} - F^{(1)}_{n,k} \right) \sum_{r=1}^{\infty} \left( F^{(2)}_{n,k} + F^{(2)}_{n,k} \right) + \sum_{r=1}^{\infty} \left( F^{(3)}_{n,k} - F^{(3)}_{n,k} \right),
\] (5.19)

Since \(g_n\) and \(g\) are continuous with \(\lim_{n \to \infty} g_n(C_n) = g(C)\) for any sequence \(C_n, C \in M_{pd \times pd}(\mathbb{R})\) with \(\lim_{n \to \infty} C_n = C\), we can apply a generalized version of the continuous mapping theorem (cf. Whitt [46],

17
Hence, \( \sum_{k=1}^{n} \mathbf{Z}(k_h) \mathbf{Z}(k_h) = \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) + \sum_{k=1}^{n} \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \) and

\[
\sum_{k=1}^{n} \mathbf{Z}(k_h) \mathbf{Z}(k_h) \mathbf{Z}(k_h) = \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) + \sum_{k=1}^{n} \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h)
\]

Step 2. Let \( \alpha \in (0, 2) \) and \( \mathbf{L}_1 \) be some Lévy process. We use the decomposition of \( \mathbf{L}_1 = \mathbf{L}_1^{(1)} + \mathbf{L}_1^{(2)} \) and \( \xi_{n,k} = \xi_{n,k}^{(1)} + \xi_{n,k}^{(2)} \) as given in (A.3) and (A.4), respectively, such that

\[
\mathbf{Z}(t) = \int_{-\infty}^{t} e^{-\Lambda(t-s)} \mathbf{B} d\mathbf{L}_1^{(1)}(s) + \int_{-\infty}^{t} e^{-\Lambda(t-s)} \mathbf{B} d\mathbf{L}_1^{(2)}(s) = \mathbf{Z}_1(t) + \mathbf{Z}_2(t) \quad \text{for } t \geq 0,
\]

and

\[
\sum_{k=1}^{n} \mathbf{Z}(k_h) \mathbf{Z}(k_h) \mathbf{Z}(k_h) = \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) + \sum_{k=1}^{n} \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) = \sum_{k=1}^{n} \mathbf{I}_1 + \sum_{k=1}^{n} \mathbf{I}_2 + \sum_{k=1}^{n} \mathbf{I}_3 + \sum_{k=1}^{n} \mathbf{I}_4.
\]

Applying Step 1 we obtain as \( n \to \infty \),

\[
\begin{align*}
\mathbf{h}_n \alpha_n^2 \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) & \Rightarrow \int_{0}^{\infty} e^{-\Lambda_s} [\mathbf{B} \mathbf{S}_1, \mathbf{B} \mathbf{S}_1] e^{-\Lambda_s} ds.
\end{align*}
\]

Furthermore, Hölder inequality results in the decomposition

\[
\begin{align*}
\mathbf{h}_n \alpha_n^2 \max(\|\mathbf{I}_1\|, \|\mathbf{I}_3\|) \leq \left( \sum_{k=1}^{n} \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) \right)^{\frac{1}{2}} \left( \sum_{k=1}^{n} \sum_{k=1}^{n} \mathbf{Z}_2(k_h) \mathbf{Z}_2(k_h) \right)^{\frac{1}{2}}
\end{align*}
\]

of independent factors. Now we use that \( \mathbf{L}_1^{(1)} \) has the representation (A.5) and we define

\[
\mathbf{L}^*(t) := \|\mathbf{B}\| \sum_{k=1}^{N(t)} \|\mathbf{J}_k\|, \quad \mathbf{\xi}_{m,k}^* := \int_{(k-1)\lambda}^{k\lambda} e^{-\lambda(t-s)} d\mathbf{L}_1^*(s), \quad \mathbf{Z}^*(t) := \int_{-\infty}^{t} e^{-\lambda(t-s)} d\mathbf{L}^*(s).
\]

Hence,

\[
\|\mathbf{B} \mathbf{L}_1^{(1)}(t)\| \leq \mathbf{L}^*(t), \quad \|\mathbf{\xi}_{m,k}^{(1)}\| \leq \mathbf{\xi}_{m,k}^* \quad \text{and} \quad \|\mathbf{Z}_1(t)\| \leq \mathbf{Z}^*(t).
\]

Then a conclusion of Step 1 is

\[
\begin{align*}
\mathbf{h}_n \alpha_n^2 \sum_{k=1}^{n} \mathbf{Z}_1(k_h) \mathbf{Z}_1(k_h) & \leq \mathbf{h}_n \alpha_n^2 \sum_{k=1}^{n} \mathbf{Z}^*(k_h) \mathbf{Z}^*(k_h) \Rightarrow \frac{1}{\mathbf{S}} [\mathbf{S}, \mathbf{S}]_1 \quad \text{as } n \to \infty,
\end{align*}
\]

where \( \mathbf{S} = (S(t))_{t \geq 0} \) is an \( \alpha \)-stable Lévy process. Since

\[
\lim_{n \to \infty} \mathbf{h}_n \alpha_n^2 \sum_{k=1}^{n} \mathbf{E} \|\mathbf{Z}_2(k_h)\|^2 = \lim_{n \to \infty} \mathbf{h}_n \alpha_n^2 \mathbf{E} \|\mathbf{Z}_2(1)\|^2 = 0,
\]
we obtain
\[
\left(\frac{a_{nh}^{-2} I_{n}}{\sum_{k=1}^{n} \|Z_{2}(kh_{n})\|^2}\right)^{\frac{1}{2}} \to P 0 \text{ as } n \to \infty.
\] (5.26)

Hence, (5.23)-(5.26) give \( h_{n}a_{nh}^{-2} \|I_{n,2}\| \to 0 \) and \( h_{n}a_{nh}^{-2} \|I_{n,3}\| \to 0 \) as \( n \to \infty \). A conclusion of (5.26) is
\[
h_{n}a_{nh}^{-2} \|I_{n,4}\| \to 0 \text{ as } n \to \infty \text{ as well. Finally, the result follows by (5.21) and (5.22).}
\]

Step 3. Let \( \alpha = 2 \). On the one hand, by Lemma 5.8 from below we have for \( i = 2, 3, 4 \) as \( n \to \infty \),
\[
h_{n}a_{nh}^{-2} F_{n,i} \to 0_{pd \times pd}.
\] (5.27)

On the other hand, by Proposition A.1 (g) as \( n \to \infty \),
\[
S_{n} := a_{nh}^{-2} \sum_{k=1}^{n} \xi_{n,k} \xi^{t}_{n,k} \to PD \Sigma B^{t} = [BS_{1}, BS_{1}]_{1}.
\]

The same arguments as in Step 1 complete the proof.

First we present Lemma 5.7 and 5.8 and then give the proof of Theorem 3.6.

**Lemma 5.7.** Let the assumptions of Lemma 5.6 hold with \( \alpha \in (0, 2) \) and suppose that \( L_{1} \) is a compound Poisson process as given in (A.5) with characteristic triplet \( \{0_{m}, 0_{m \times m}, \nu_{1}\} \).

(a) Then \( F_{n,0}^{(1)} \to F_{n,0}^{(1)} \) and as \( n \to \infty \),
\[
h_{n}a_{nh}^{-2} F_{n,0}^{(1)} \to 0_{pd \times pd}.
\]

(b) Then as \( n \to \infty \),
\[
h_{n}a_{nh}^{-2} \sum_{k=1}^{n} \sum_{i=1}^{\infty} \left( F_{n,k,i}^{(0)} + F_{n,k,i}^{(2)} \right) \to 0_{pd \times pd}.
\]

(c) Then as \( n \to \infty \),
\[
h_{n}a_{nh}^{-2} \sum_{k=1}^{n} \sum_{i=1}^{\infty} \left( F_{n,k,i}^{(3)} + F_{n,k,i}^{(0)} - F_{n,k,i}^{(3)} - F_{n,k,i}^{(0)} \right) \to 0_{pd \times pd}.
\]

**Proof.**

(a) We use the notation given in (5.24). Then
\[
\|F_{n,0}^{(1)}\| \leq (1 - e^{-2kh_{n}})^{-1} \sum_{j=0}^{\infty} e^{-2kh_{n}j} \xi_{n,j}^{*} \xi_{n,-j}^{*} \leq (1 - e^{-2kh_{n}})^{-1} Z^{*}(0)^{2}.
\]

Hence,
\[
P(\|F_{n,0}^{(1)}\| > a_{nh}^{-2} h_{n}^{-1}) \leq P(Z^{*}(0)^{2} > C_{1}a_{nh}^{-2} ) \to 0.
\]

(b) The upper bound
\[
\left| \sum_{k=1}^{n} \sum_{i=1}^{\infty} F_{n,k,i}^{(2)} \right| \leq \sum_{k=1}^{n} \sum_{j=0}^{\infty} e^{-\lambda h_{n}(2j+1)} \xi_{n,k}^{*} \left( \sum_{r=0}^{\infty} \xi_{n,k-1-r}^{*} e^{-\lambda h_{n}r} \right)
\leq \left( 1 - e^{-2kh_{n}} \right)^{-1} \sum_{k=1}^{n} \xi_{n,k}^{*} Z^{*}(kh_{n})
\]
holds. Applying Lemma 5.1 (here we require that for a compound Poisson process \( E(\|\xi_{n,0}\|^{2}) \leq C_{2}h_{n} \) by
Lemma A.4, which is used to show (1) for some $0 < \delta < 1$, $\delta < \alpha$ and $2\delta > \alpha$ gives

$$h_n(1 - e^{-2\lambda h_n})^{-1} \xi_{n,k}^* Z^* ((k - 1) h_n) \overset{p}{\rightarrow} 0 \quad \text{as } n \to \infty. \quad (5.29)$$

On the other hand, if we define $W^r(k h_n) := \sum_{r=0}^{\infty} e^{-\lambda h_n} \xi_{n,k+r}^*$, then $W^r(k h_n) \overset{d}{=} Z^* (0)$ and

$$\left\| \sum_{k=1}^{n} \sum_{r=1}^{\infty} F_{n,k-r}^{(2)} \right\| \leq \sum_{k=1}^{n} \sum_{j=1}^{\infty} e^{-2\lambda h_n} \xi_{n,k}^* \xi_{n,k+r}^* e^{\lambda h_n}$$

$$\leq (1 - e^{-2\lambda h_n})^{-1} \sum_{k=1}^{n} \xi_{n,k}^* W^r ((k + 1) h_n). \quad (5.30)$$

Using again Lemma 5.1 yields

$$h_n(1 - e^{-2\lambda h_n})^{-1} \xi_{n,k}^* W^r ((k + 1) h_n) \overset{p}{\rightarrow} 0 \quad \text{as } n \to \infty. \quad (5.31)$$

Hence, (5.28)-(5.31) give the statement.

(c) We will show that on the one hand,

$$h_n a_{n,h}^{-2} \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \overset{p}{\rightarrow} 0 \quad \text{as } n \to \infty,$$

and on the other hand,

$$h_n a_{n,h}^{-2} \sum_{r=1}^{\infty} F_{n,0,-r}^{(3)} \overset{p}{\rightarrow} 0 \quad \text{as } n \to \infty.$$

Since $\sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \overset{d}{=} \sum_{r=1}^{\infty} F_{n,n,r}^{(3)}$ and $\sum_{r=1}^{\infty} F_{n,0,-r}^{(3)} \overset{d}{=} \sum_{r=1}^{\infty} F_{n,n,-r}^{(3)}$ the proof will then be finished. Again we use the notation given in (5.24). For the first term we derive the upper bound

$$\left\| \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \right\| \leq \sum_{j=0}^{\infty} \sum_{r=j+1}^{\infty} e^{-2\lambda h_n} \xi_{n,-j}^* \left( \sum_{r=0}^{\infty} e^{-\lambda h_n} \xi_{n,-j-1}^* \right)^{\delta}$$

$$\leq (1 - e^{-2\lambda h_n})^{-1} \sum_{j=0}^{\infty} e^{-2\lambda h_n} \xi_{n,-j}^* Z^* ((-j - 1) h_n).$$

Applying for $0 < \delta < \alpha$, $\delta \leq 1$, 

$$\mathbb{E} \left( \left( \sum_{j=0}^{\infty} e^{-2\lambda h_n} \xi_{n,-j}^* Z^* ((-j - 1) h_n) \right)^{\delta} \right) \leq \sum_{j=0}^{\infty} e^{-2\delta \lambda h_n} \mathbb{E}(\xi_{n,0} \delta) \mathbb{E}(Z^* (0)^{\delta}),$$

where we used the independence of $\xi_{n,-j}^*$ and $Z^* ((-j - 1) h_n)$ in the first inequality, and Lemma A.4 results in

$$h_n \delta a_{n,h}^{-2\delta} \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \overset{p}{\rightarrow} 0.$$
For the second term we have the upper bound

\[
\left\| \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \right\| \leq \sum_{r=1}^{\infty} \sum_{j=0}^{\infty} e^{-2\lambda h_0} \sum_{\alpha=1}^{\infty} e^{-\lambda h_0 (s-r)} = (1 - e^{-2\lambda h_0})^{-1} \sum_{j=0}^{\infty} e^{-2\lambda h_0 (j+1)} e^{\lambda h_0} + (1 - e^{-2\lambda h_0})^{-1} \sum_{j=0}^{\infty} e^{-2\lambda h_0} e^{\lambda h_0} =: I_{n,1} + I_{n,2}. \tag{5.32}
\]

Moreover,

\[
I_{n,1} = (1 - e^{-2\lambda h_0})^{-1} e^{-2\lambda h_0} \sum_{j=0}^{\infty} e^{-\lambda h_0} \sum_{\alpha=1}^{\infty} e^{-\lambda h_0 (j+r)} \leq (1 - e^{-2\lambda h_0})^{-1} Z^* (0)^2, \tag{5.33}
\]

and

\[
I_{n,2} = (1 - e^{-2\lambda h_0})^{-1} e^{-2\lambda h_0} Z^* (0) \tilde{Z} (0), \tag{5.34}
\]

where \( \tilde{Z} (0) \) is an independent copy of \( Z^* (0) \). A conclusion of (5.32)-(5.34) is that for any \( \varepsilon > 0 \),

\[
P \left( h_n a_{\alpha h_0}^{-2} \left\| \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} \right\| > \varepsilon \right) \leq P(Z^* (0)^2 + Z^* (0) \tilde{Z} (0)) + C_{a_{\alpha h_0}}^2 \rightarrow 0 \quad \text{as } n \rightarrow \infty,
\]

what was the aim to show.

\( \square \)

**Lemma 5.8.** Let the assumptions of Lemma 5.6 hold with \( \alpha = 2 \).

(a) Then \( F_{n,0}^{(1)} \) \( d \)-converges to \( F_{n,n}^{(1)} \) and as \( n \rightarrow \infty \),

\[
h_n a_{\alpha h_0}^{-2} F_{n,0}^{(1)} \xrightarrow{p} \theta_{pd \times pd}.
\]

(b) Then as \( n \rightarrow \infty \),

\[
h_n a_{\alpha h_0}^{-2} \sum_{k=1}^{n} \sum_{r=1}^{\infty} (F_{n,k,r}^{(2)} + F_{n,k,-r}^{(2)}) \xrightarrow{p} \theta_{pd \times pd}.
\]

(c) Then as \( n \rightarrow \infty \),

\[
h_n a_{\alpha h_0}^{-2} \sum_{r=1}^{\infty} \left( F_{n,0,r}^{(3)} + F_{n,n,-r}^{(3)} - F_{n,n,r}^{(3)} \right) \xrightarrow{p} \theta_{pd \times pd}.
\]

**Proof.**

(a) We rewrite

\[
F_{n,0}^{(1)} = \sum_{s=0}^{\infty} e^{-\lambda h_0 (s+1)} \left( \sum_{j=0}^{\infty} e^{-\lambda h_0} \sum_{r=1}^{\infty} e^{-\lambda h_0 (s-r)} \right) e^{-\lambda h_0}.
\]
Let us start with

\[ S_n := \sum_{j=0}^{\infty} e^{-\Lambda h_j} \xi_{n-j} \xi'_{n-j} e^{-\Lambda h_j}, \]

the equality \( h_n a_{nh_j}^{-2} F_{n,0}^{(1)} = e^{-\Lambda h_j} g_n(S_n) e^{-\Lambda h_j} \) is valid. If we are able to prove that \( S_n \overset{p}{\to} \theta_{pd \times pd} \) as \( n \to \infty \), then with a generalized continuous mapping theorem (the same arguments as in the proof of Lemma 5.6) we can conclude \( h_n a_{nh_j}^{-2} F_{n,0}^{(1)} \overset{p}{\to} \theta_{pd \times pd} \) as \( n \to \infty \). Finally, due to Proposition A.1 (a)

\[ \mathbb{E} \| S_n \| \leq a_{nh_j}^{-2} \sum_{j=0}^{\infty} e^{-2\lambda h_j} \mathbb{E} \| \xi_{n,0} \|^2 \leq C_1 a_{nh_j} \overset{n \to \infty}{\to} 0, \]

and \( S_n \overset{p}{\to} \theta_{pd \times pd} \) as \( n \to \infty \).

(b) The representation

\[ h_n a_{nh_j}^{-2} \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} F_{n,k-r}^{(2)} = \sum_{j=0}^{\infty} e^{-\Lambda h_j} \left( a_{nh_j}^{-2} \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} e^{-\Lambda h_r} \xi_{n,k} \xi'_{n,k+r} \right) e^{-\Lambda h_j} h_n. \]

holds. Using the same arguments as in (a) it is sufficient to prove that as \( n \to \infty \),

\[ a_{nh_j}^{-2} \sum_{k=1}^{\infty} \xi_{n,k} \xi'_{n,k+r} \overset{p}{\to} \theta_{pd \times pd}. \]

However, this follows from Proposition A.1 and Lemma 5.1. Similarly,

\[ h_n a_{nh_j}^{-2} \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} F_{n,k-r}^{(2)} = \sum_{j=0}^{\infty} e^{-\Lambda h_j} \left( a_{nh_j}^{-2} \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} e^{-\Lambda h_r} \xi_{n,k} \xi'_{n,k+r} \right) e^{-\Lambda h_j} h_n. \]

As in (a) it is sufficient to show that

\[ a_{nh_j}^{-2} \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} e^{-\Lambda h_r} \xi_{n,k} \xi'_{n,k+r} \overset{p}{\to} \theta_{pd \times pd}. \]

(5.35)

We prove the convergence of (5.35) componentwise. The sequence of \((l,m)\)-components

\[ (e^{-\Lambda h_r} \xi_{n,k} \xi'_{n,k+r})_{(l,m)} \]

is uncorrelated such that

\[ \mathbb{E} \left( \left( \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} e^{-\Lambda h_r} \xi_{n,k} \xi'_{n,k+r} (l,m) \right)^2 \right) \leq C_2 \sum_{k=1}^{\infty} \sum_{r=1}^{\infty} e^{-2\lambda h_r} \mathbb{E} \left( \| \xi_{n,0} \|^2 \right)^2 \leq C_3 n h_n. \]

Thus, (5.35) holds.

(c) Let us start with

\[ h_n a_{nh_j}^{-2} \sum_{r=1}^{\infty} F_{n,0,r}^{(3)} = \sum_{s=0}^{\infty} e^{-\Lambda h_s+1} \left( a_{nh_j}^{-2} \sum_{j=0}^{\infty} e^{-\Lambda h_s} \xi_{n-j} \xi'_{n-j} \right) e^{-\Lambda h_j} h_n. \]

As before it is sufficient to show that

\[ a_{nh_j}^{-2} \sum_{j=0}^{\infty} e^{-\Lambda h_j} \xi_{n-j} \xi'_{n-j} \overset{p}{\to} \theta_{pd \times pd} \] as \( n \to \infty. \)
We prove it componentwise using the uncorrelation of the sequence of the \((l,m)\)-components 
\((\xi_{n,-j}Z((-j -1)h_n) , \xi_{n,j}Z((-j -1)h_n)e^{-N\Lambda h_n}) \) for the \((l,m)\)-component we have
\[
a_{mn}^{-1}E \left( \sum_{j=0}^{\infty} e^{-A_{h_n}j} \xi_{n,-j}Z((-j -1)h_n) e^{-N\Lambda h_n}) \right)^2_{(l,m)} = a_{mn}^{-1} \sum_{j=0}^{\infty} E \left( e^{-A_{h_n}j} \xi_{n,-j}Z((-j -1)h_n) e^{-N\Lambda h_n}) \right)^2_{(l,m)} \\
\leq a_{mn}^{-1} C_1 \sum_{j=0}^{\infty} e^{-KL h_n} e\|\xi_n\| E\|Z(0)\|^2 \leq C_5 e^{-KL h_n} \to 0.
\]
Now we investigate
\[
\sum_{r=1}^{\infty} F_{n,0,-r}^{1(3)} = \sum_{j=0}^{\infty} j \sum_{j=1}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \xi_{n,j-t} e^{-N\Lambda h_n} + \sum_{j=0}^{\infty} \sum_{j=1}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \xi_{n,j-t} e^{-N\Lambda h_n} \\
= I_{n,1} + I_{n,2}.
\]
Then
\[
I_{n,1} = \lim_{n \to \infty} e^{-A_{h_n}(r+1)} \left( \sum_{j=0}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \sum_{j=0}^{r} e^{-A_{h_n}(j-r)} \right) e^{-N\Lambda h_n} 
\]
For the convergence \(h_n u^{-2} I_{n,1} \to 0 \) as \( n \to \infty \) it is again sufficient to show that
\[
a_{mn}^{-4} \sum_{j=0}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \sum_{j=0}^{r} e^{-A_{h_n}(j-r)} \to 0 \quad \text{as} \quad n \to \infty,
\]
what we will prove componentwise. Since the \((l,m)\)-components \( ((e^{-A_{h_n}j} \xi_{n,-j} \sum_{u=0}^{j-1} e^{-A_{h_n}u})_{(l,m)}) \) are uncorrelated
\[
E \left( \sum_{j=0}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \sum_{j=0}^{r} e^{-A_{h_n}(j-r)} \right)^2_{(l,m)} = \sum_{j=0}^{\infty} E \left( e^{-A_{h_n}j} \xi_{n,-j} \sum_{j=0}^{j-1} e^{-A_{h_n}u} \right)^2_{(l,m)}.
\]
Furthermore, by Proposition A.1 (a) we get
\[
E \left| e^{-A_{h_n}j} \xi_{n,-j} \right|^2 \leq C_6 e^{-2KL h_n} \xi_n \leq C_7 h_n e^{-2KL h_n},
\]
and
\[
E \left| \sum_{u=0}^{j-1} e^{-A_{h_n}u} \right|^2 \leq C_8 \sum_{u=0}^{j-1} e^{-2KL h_n} \xi_n \leq C_9.
\]
Hence, (5.38)-(5.40) and the independence of \( e^{-A_{h_n}j} \xi_{n,-j} \) and \( \sum_{u=0}^{j-1} e^{-A_{h_n}u} \) give
\[
E \left( \sum_{j=0}^{\infty} e^{-A_{h_n}j} \xi_{n,-j} \sum_{j=0}^{j-1} e^{-A_{h_n}u} \right)^2_{(l,m)} \leq C_{10} h_n \sum_{j=0}^{\infty} e^{-2KL h_n} \leq C_{11},
\]
which results in (5.37).
Next we have to show that $h_n a_{mh}^{-2} I_{n,2} \overset{p}{\to} 0_{pd \times pd}$ as $n \to \infty$. Therefore we use the representation

$$I_{n,2} = \sum_{j=0}^{\infty} \sum_{r=j+1}^{\infty} e^{-\Lambda h_{r,j}} \left( \sum_{j=0}^{\infty} \sum_{r=j+1}^{\infty} e^{-\Lambda h_{r,j}} \xi_{n,j} \xi'_{n,j+r} \right) e^{-\Lambda h_{r,j}}$$

and prove that as $n \to \infty$,

$$a_{mh}^{-2} \sum_{j=0}^{\infty} \sum_{r=j+1}^{\infty} e^{-\Lambda h_{r,j}} \xi_{n,j} \xi'_{n,j+r} = a_{mh}^{-2} \sum_{j=0}^{\infty} \sum_{u=1}^{\infty} e^{-\Lambda h_{u,j}} \sum_{j=0}^{\infty} e^{-\Lambda h_{u,j}} \xi_{n,j} \xi'_{n,j+u} \overset{p}{\to} 0_{pd \times pd}. \tag{5.41}$$

By the uncorrelation of the components of $\left( e^{-\Lambda h_{u,j}} e^{-\Lambda h_{u,j}} \xi_{n,j} \xi'_{n,j+u} \right)_{j,u \in \mathbb{N}}$ we obtain similarly as above

$$\mathbb{E} \left( \sum_{j=0}^{\infty} \sum_{u=1}^{\infty} e^{-\Lambda h_{u,j}} \xi_{n,j} \xi'_{n,j+u} \right)^2 \leq \sum_{j=0}^{\infty} \sum_{u=1}^{\infty} \mathbb{E} \left( e^{-\Lambda h_{u,j}} e^{-\Lambda h_{u,j}} \xi_{n,j} \xi'_{n,j+u} \right)^2 \leq C_{12} \sum_{j=0}^{\infty} e^{-2 \lambda h_{u,j}} \sum_{u=0}^{\infty} e^{-2 \lambda h_{u,j}} \mathbb{E} \left( \xi_{n,j} \xi'_{n,j+u} \right)^2 \leq C_{13}.$$

After all this gives (5.41) and $h_n a_{mh}^{-2} I_{n,2} \overset{p}{\to} 0_{pd \times pd}$ as $n \to \infty$. \hfill $\Box$

Finally, we are able to prove the main statement in Theorem 3.6.

**Proof of Theorem 3.6.**

(a) The observation equation (2.3) and Lemma 5.6 yield

$$h_n a_{mh}^{-2} \sum_{k=1}^{n} V(kh_n) V(kh_n)' = h_n a_{mh}^{-2} \sum_{k=1}^{n} E Z(kh_n) Z(kh_n)' E' \Rightarrow \int_0^\infty \mathbb{E} e^{-\Lambda B} [S_1, S_1]' B' e^{-\Lambda B'} ds = \int_0^\infty f(s) [S_1, S_1]' f(s)' ds \quad \text{as } n \to \infty.$$

(b) An application of Fasen [16], Proposition 2.1, gives that with $g(s) = e^{-\Lambda B} B 1_{(0,\infty)}(s)$

$$a_n^{-2} \sum_{k=1}^{n} Z(kh) Z(kh)' \Rightarrow [S_{g,h}, S_{g,h}]_1 \quad \text{as } n \to \infty,$$

such that

$$a_n^{-2} \sum_{k=1}^{n} V(kh) V(kh)' \Rightarrow E [S_{g,h}, S_{g,h}]_1 E' = [E S_{g,h}, E S_{g,h}]_1 \overset{d}{=} [S_{g,h}, S_{g,h}]_1 \quad \text{as } n \to \infty,$$

is the result. \hfill $\Box$

**A. Appendix: Asymptotic behavior of stochastic integrals**

In the appendix we present the tail behavior and extensions of Karamata’s Theorem to stochastic integrals of the form $\int_0^\infty f(s) dL(s)$ where $h_n \downarrow 0$ as $n \to \infty$. First, we start with a driving Lévy process which has a finite second moment. In the subsequent subsection the driving Lévy process has a regularly varying tail.
A.1. Finite second moments

Proposition A.1. Let \((L(t))_{t \geq 0}\) be an \(\mathbb{R}^d\)-valued Lévy process with \(E\|L(1)\|^2 < \infty\) and \(E(L(1)L(1)') = \Sigma\). Suppose \((h_n)_{n \in \mathbb{N}}\) is a sequence of positive constants such that \(h_n \downarrow 0\) and \(\lim_{n \to \infty} nh_n = \infty\). Moreover, let \(f : \mathbb{R} \to \mathbb{R}^m\) be a measurable and bounded function with \(\lim_{x \to 0} f(x) = f(0)\). Define \(\xi_n = \int_0^{h_n} f(s) dL(s)\) for \(n \in \mathbb{N}\). Finally, let \(\delta \in (0, 2]\) and let \(x > 0\).

(a) There exists a finite positive constant \(K\) such that
\[
E h_n^{-1} E\|\xi_n\|^2 \leq K \quad \forall n \in \mathbb{N}.
\]

(b) If \(E\|L(1)\|^4 < \infty\), then \(\lim_{n \to \infty} E h_n^{-1} E\|\xi_n\|^2 = E\|f(0)L(1)\|^2\).

(c) \(n \mathbb{P}(nh_n^{-1/2} \xi_n \in \cdot) \xrightarrow{\mathcal{L}} 0\) as \(n \to \infty\) on \(\mathcal{B}(\mathbb{R}^n \setminus \{0\})\).

(d) \(\lim_{n \to \infty} n h_n^{-1/2} E(\|\xi_n\|^2 I_{\{||\xi_n|| > \sqrt{\delta m} n\}}) = 0\).

Proof. (a) Suppose \(E(L(1)) = 0_d\). Due to (2.10) in Marquardt and Stelzer [28] the covariance matrix of \(\xi_n\) is \(\int_0^{h_n} f(s) \Sigma f(s)' ds\). Hence, we obtain as \(n \to \infty\),
\[
E\|\xi_n\|^2 = \int_0^{h_n} E(\|\text{diag}(f(s) \Sigma f(s)')\|^2) ds \sim h_n E(\|\text{diag}(f(0) \Sigma f(0)')\|^2) = h_n E\|f(0)L(1)\|^2,
\]
where \(\text{diag}(B)\) denotes the vector containing the diagonal elements of \(B\).

Suppose \(E(L(1)) \neq 0_d\). Then define \(L(t) := L(t) - t E(L(1))\) for \(t \geq 0\) and use the upper bound
\[
E\|\xi_n\|^2 \leq 4 E\left\| \int_0^{h_n} f(s) dL(s) \right\|^2 + C_1 h_n^2.
\]
A conclusion of (A.1) is the statement.

(b) Suppose \(E(L(1)) = 0_d\). The characteristic function of \(\xi(t) = \int_0^t f(s) dL(s) =: (\xi_1(t), \ldots, \xi_m(t))'\) is \(E(\exp(\text{i}\Theta^t \xi(t))) = \exp(-\Psi_{t\Theta}(\Theta))\) for \(\Theta \in \mathbb{R}^m\) where
\[
\Psi_{t\Theta}(\Theta) = \int_0^t \Psi(\Theta^t f(s)) ds
\]
(cf. Rajput and Rosinski [37], Proposition 2.6). Hence, for \(k = 1, \ldots, m\) and \(\eta_k = (0, \ldots, 0, 1, 0, \ldots, 0)' \in \mathbb{R}^m\)
\[ \mathbb{E}[x(t)]^2 = \frac{d}{d\theta} \mathbb{E} \left[ e^{\theta x(s)} \right] \bigg|_{\theta=0} = 3 \left( \frac{d}{d\theta} \Psi_{f_1}(\theta e_k) \bigg|_{\theta=0} \right)^2 - \left( \frac{d}{d\theta} \Psi_{f_2}(\theta e_k) \bigg|_{\theta=0} \right)^2 \]
\[ \sim 3t^2 C_2 + tC_3 \quad \text{as } t \to 0. \]

Finally,
\[ \mathbb{E}\|\xi_n\|^4 \leq C_4 \sum_{k=1}^{m} \mathbb{E}\|\xi_k(h_n)\|^4 \leq C_5 h_n \quad \forall \ n \in \mathbb{N}. \]  

Suppose \( \mathbb{E}(L(1)) \neq 0_d \). Then by (A.2)
\[ \mathbb{E}\|\xi_n\|^4 \leq 8\mathbb{E}\left\| \int_0^{h_n} f(s) \, d\mathbb{L}(s) \right\|^4 + C_6 h_n \leq C_7 h_n. \]

(c) In the following \( f^* := \sup_{s \in \mathbb{R}} \|f(s)\| \). Let \( (\gamma_L, \Sigma_L, \nu_L) \) be the characteristic triplet of \( (L(t))_{t \geq 0} \) and \( \mathbb{B}^{d-1} = \{x \in \mathbb{R}^d : \|x\| \leq 1\} \) be the unit ball in \( \mathbb{R}^d \). We factorize the Lévy measure \( \nu_L \) into two Lévy measures
\[ \nu_{L_1}(A) := \nu_L(A \setminus \mathbb{B}^{d-1}) \quad \text{and} \quad \nu_{L_2}(A) := \nu_L(A \cap \mathbb{B}^{d-1}) \quad \text{for } A \in \mathcal{B}(\mathbb{R}^d \setminus \{0_d\}) \]
such that \( \nu_L = \nu_{L_1} + \nu_{L_2} \). Then we can decompose \( (L(t))_{t \geq 0} \) into two independent Lévy processes
\[ L(t) = L^{(1)}(t) + L^{(2)}(t) \quad \text{for } t \geq 0, \]  
where \( L^{(1)} = (L^{(1)}(t))_{t \geq 0} \) has the characteristic triplet \((0_d, \nu_{L_1}, \nu_{L_1})\) and \( L^{(2)} = (L^{(2)}(t))_{t \geq 0} \) has the characteristic triplet \((\gamma_L, \Sigma_L, \nu_{L_2})\). Then
\[ \xi_n = \int_0^{h_n} f(s) \, dL^{(1)}(s) + \int_0^{h_n} f(s) \, dL^{(2)}(s) =: \xi_n^{(1)} + \xi_n^{(2)}, \]  
and \( \xi_n^{(1)} \) and \( \xi_n^{(2)} \) are independent. Since the Lévy measure of \( L^{(1)} \) is finite and \( L^{(1)} \) is without Gaussian part and drift, \( L^{(1)} \) has the representation as a compound Poisson process
\[ L^{(1)}(t) = \sum_{k=1}^{N(t)} J_k, \quad t \geq 0, \quad \text{and} \quad \xi_n^{(1)} = \sum_{k=1}^{N(h_n)} f(\Gamma_k) J_k, \]
where \( (J_k)_{k \in \mathbb{N}} \) is a sequence of iid random vectors independent of the Poisson process \( (N(t))_{t \geq 0} \) with intensity \( \lambda = \nu_{L_1}(\mathbb{R}^d) \) and jump times \((\Gamma_k)_{k \in \mathbb{N}}\). Now, let \( B \) be a relatively compact set in \( \mathcal{B}(\mathbb{R}^d \setminus \{0_d\}) \) with \( \mu(\partial B) = 0 \) and \( \gamma_B = \inf_{x \in B} \|x\| \), which is larger than 0. Then
\[ n \mathbb{P}(\|x_n\|^{-1/2} \xi_n \in B) \leq n \mathbb{P}(\|\xi_n^{(1)}\| > \gamma_B \sqrt{nh_n}/2) + n \mathbb{P}(\|\xi_n^{(2)}\| > \gamma_B \sqrt{nh_n}/2). \]

First, we will show that the first summand with \( \xi_n^{(1)} \) converges to 0. Therefore, we will use the next conclusions. On the one hand, for \( l \geq 1 \),
\[ \frac{\mathbb{P}(N(h_n) = l)}{h_n} = e^{-\lambda h_n} \frac{(\lambda h_n)^l}{h_n!} \leq C_6 \mathbb{P}(N(1) = l). \]
On the other hand, for \( l \geq 2 \),
\[
\lim_{n \to \infty} \frac{\mathbb{P}(N(h_n) = l)}{h_n} = \lim_{n \to \infty} e^{-\lambda h_n} \frac{\lambda^l h_n^{l-1}}{l!} = 0.
\] (A.7)

Finally,
\[
\lim_{n \to \infty} \frac{\mathbb{P}(N(h_n) = 1)}{h_n} = \lim_{n \to \infty} e^{-\lambda h_n} \lambda = \lambda.
\] (A.8)

If \( U_{1,1} < U_{1,2} < \ldots < U_{l,l} \) denotes the order statistic of \( l \) iid uniform random variables on \((0,1)\) then
\[
n\mathbb{P}(\| \xi_n^{(1)} \| > \gamma h \sqrt{nh_n}/2) = n \sum_{l=1}^{\infty} \mathbb{P}\left( \bigg\| \sum_{k=1}^{N(1)} f(h_n U_{l,k}) J_k \bigg\| > \gamma h \sqrt{nh_n}/2 \right) \mathbb{P}(N(h_n) = l)
\]
(see Resnick [38], Theorem 4.5.2). On the one hand, by (A.6)
\[
n\mathbb{P}(\| \xi_n^{(1)} \| > \gamma h \sqrt{nh_n}/2) \leq nh_n C_0 \mathbb{P}\left( f^* \sum_{k=1}^{N(1)} \| J_k \| > \gamma h \sqrt{nh_n}/2 \right)
\]
\[
\leq C_0 \int_{\gamma h \sqrt{nh_n}/2}^{+\infty} x^2 \mathbb{P}\left( f^* \sum_{k=1}^{N(1)} \| J_k \| < x \right) \frac{dx}{n h_n} \to 0,
\]
since \( \mathbb{E}(\| \xi_n^{(1)} \|^2) < \infty \) by Sato [42], Corollary 25.8. On the other hand, since the Lévy measure of \( L^{(2)} \) has compact support, all moments of \( L^{(2)}(1) \) are finite (cf. Sato [42], Corollary 25.8), such that a conclusion of (b) is
\[
n\mathbb{P}(\| \xi_n^{(2)} \| > \gamma h \sqrt{nh_n}/2) \leq n(\gamma h \sqrt{nh_n}/2)^{-4} \mathbb{E}(\| \xi_n^{(2)} \|^4) \leq C_{11} n(h_n)^{-2} h_n \frac{\mathbb{P}(N(h_n) = l)}{h_n} = 0.
\]
(d) Note that for any random variable \( X \) with \( \mathbb{E}|X|^2 < \infty \) the limit \( \lim_{y \to +\infty} y^2 \mathbb{P}(|X| > y) = 0 \) and \( \lim_{y \to +\infty} y^{2-\delta} \mathbb{E}(|X|^{\delta} 1_{\{X > y\}}) = 0 \) (apply Hölder inequality) holds. Then
\[
n(\mathbb{E}(\| \xi_n \|^2))^{\frac{\delta}{2}} \mathbb{E}(\| \xi_n^{(1)} \|^2 \| \xi_n^{(2)} \|^2) \leq C_{12} (nh_n)^{-\frac{\delta}{2}} \mathbb{E}\left( \left( \int_{\gamma h \sqrt{nh_n}/2}^{+\infty} x^2 \mathbb{P}(\| \xi_n^{(2)} \| > \sqrt{nh_n} x) + \delta \int_{\sqrt{nh_n} x}^{+\infty} x^{\delta-4} \mathbb{E}(\| \xi_n^{(2)} \|^4) x^{-4} dx \right)\right) \to 0.
\] (A.9)

Moreover, by Markov’s inequality
\[
n(\mathbb{E}(\| \xi_n \|^2))^{\frac{\delta}{2}} \mathbb{E}(\| \xi_n^{(1)} \|^2 \| \xi_n^{(2)} \|^2) \leq C_{13} (nh_n)^{-1} \to 0.
\] (A.10)

Taking \( \mathbb{E}(\| \xi_n \|^2) \leq (\mathbb{E}(\| \xi_n^{(2)} \|^2))^{\frac{\delta}{2}} \leq C_{14} h_n^{\frac{\delta}{2}} \) into account, the inequality
\[
n(\mathbb{E}(\| \xi_n \|^2))^{\frac{\delta}{2}} \mathbb{E}(\| \xi_n^{(1)} \|^2 \| \xi_n^{(2)} \|^2) \leq C_{15} (nh_n)^{-1} \to 0
\] (A.11)
is valid. Finally, applying (A.9)-(A.11) yields
\[
\begin{align*}
n(nh_n)^{-\frac{1}{2}} & \mathbb{E} (\| \xi_n \|^{\delta_1} \mathbb{1}_{\{ \| \xi_n \| > \sqrt{\alpha n} \}}) \\
& \leq 2\delta n(nh_n)^{-\frac{1}{2}} \mathbb{E} (\| \xi_n^{(1)} \|^{\delta_1} \mathbb{1}_{\{ \| \xi_n^{(1)} \| > \sqrt{\alpha n} \}}) + 2\delta n(nh_n)^{-\frac{1}{2}} \mathbb{E} (\| \xi_n^{(2)} \|^{\delta_1} \mathbb{1}_{\{ \| \xi_n^{(2)} \| > \sqrt{\alpha n} \}}) \\
& \quad + 2\delta n(nh_n)^{-\frac{1}{2}} \mathbb{E} (\| \xi_n \|^{\delta_1} \mathbb{1}_{\{ \| \xi_n \| > \sqrt{\alpha n} \}}) \to 0.
\end{align*}
\]

\(f\) Since \(\mathbb{E}(\xi_n) = 0_m\), an application of (d) results in
\[
\lim_{n \to \infty} n(nh_n)^{-1/2} \mathbb{E}(\xi_n \mathbb{1}_{\{ \| \xi_n \| \leq \sqrt{\alpha n} \}}) = \lim_{n \to \infty} n(nh_n)^{-1/2} \mathbb{E}(\xi_n \mathbb{1}_{\{ \| \xi_n \| > \sqrt{\alpha n} \}}) = 0.
\]

\(g\) Gut [21], Theorem 3.1, and
\[
\lim_{n \to \infty} h_n^{-1} \mathbb{E}(\xi_n \xi^\prime_n) = \lim_{n \to \infty} h_n^{-1} \int_0^{h_n} f(s) \Sigma f(s)^\prime ds = f(0) \Sigma f(0)^\prime
\]
gives \((nh_n)^{-1} \sum_{k=1}^{n} \xi_{n,k} \xi^\prime_{n,k} \to f(0) \Sigma f(0)^\prime\) as \(n \to \infty\).

\section*{A.2. Infinite second moments}

Moreover, we present some asymptotic results for \(L(1) \in \mathbb{R}^{-\alpha}(a_n, \mu), \alpha \in (0, 2)\).

\begin{proposition}
Let \((L(t))_{t \geq 0}\) be an \(\mathbb{R}^d\)-valued Lévy process with \(L(1) \in \mathbb{R}^{-\alpha}(a_n, \mu), 0 < \alpha < 2\). Suppose \((h_n)_{n \in \mathbb{N}}\) is a sequence of positive constants such that \(h_n \to 0\) and \(\lim_{n \to \infty} nh_n = \infty\). Set \(a_t := a_t|\) for \(t \geq 0\). Let \(f : \mathbb{R} \to \mathbb{R}^{m \times d}\) be a measurable and bounded function with \(\lim_{x \to 0} f(x) = f(0)\). Define \(\xi_n = \int_0^{h_n} f(s) \Sigma f(s)^\prime ds\) for \(n \in \mathbb{N}\).

(a) Then
\[
n(nh_n)^{-\frac{1}{2}} \mathbb{P}(a_{nh_n}^{-1} \xi_n \in \cdot) \Rightarrow \mu \circ f(0)^{-1}(-) \quad \text{on} \ \mathbb{R}(\mathbb{R} \setminus \{0_m\})
\]

(b) There exists a finite positive constant \(K\) such that
\[
\lim_{n \to \infty} n \mathbb{P}(\| \xi_n \| > a_{nh_n} x) = K x^{-\alpha} \quad \text{for} \ x > 0.
\]

(c) Let either \(\delta \geq 2\), or \(\delta > \alpha\) and \((L(t))_{t \geq 0}\) be a compound Poisson process. Then there exists for every \(x > 0\) a finite positive constant \(K_{\delta}\) such that
\[
n a_{nh_n}^{-\delta} \mathbb{E}(\| \xi_n \|^{\delta} \mathbb{1}_{\{\| \xi_n \| \leq a_{nh_n} x\}}) \leq K_{\delta} x^{-\alpha} \quad \forall n \in \mathbb{N}.
\]

(d) Let \(\delta \in (0, \alpha)\). Then there exists for every \(x > 0\) a finite positive constant \(K_{\delta}\) such that
\[
n a_{nh_n}^{-\delta} \mathbb{E}(\| \xi_n \|^{\delta} \mathbb{1}_{\{\| \xi_n \| > a_{nh_n} x\}}) \leq K_{\delta} x^{-\alpha} \quad \forall n \in \mathbb{N}.
\]

(e) Suppose that \(\alpha \neq 1\) and \(\mathbb{E}(L(1)) = 0_d\) if \(1 < \alpha < 2\). Then there exists for any \(x > 0\) a finite positive constant \(K\) such that
\[
n a_{nh_n}^{-1} \mathbb{E}(\xi_n \mathbb{1}_{\{\| \xi_n \| \leq a_{nh_n} x\}}) \leq K x^{1-\alpha} \quad \forall n \in \mathbb{N}.
\]

The proof of Proposition A.2 uses the next two Lemmata.
Lemma A.3. Let \((L(t))_{t \geq 0}\) be an \(\mathbb{R}^d\)-valued Lévy process with \(E\|L(1)\|^2 < \infty\), \((a_i)_{i \geq 0}\) be an increasing sequence of positive constants in \(\mathbb{R}^d_\alpha\), \(0 < \alpha < 2\), and \((h_n)_{n \in \mathbb{N}}\) be a sequence of positive constants such that \(h_n \to 0\) as \(n \to \infty\) and \(\lim_{n \to \infty} nh_n = \infty\). Moreover, let \(f : \mathbb{R} \to \mathbb{R}^{m \times d}\) be a measurable and bounded function with \(\lim_{s \to a} f(x) = f(0)\). Define \(\xi_n^a = \int_0^{h_n} f(s) \, dL(s)\) for \(n \in \mathbb{N}\). Finally, let \((\alpha - 1)_+ < \delta < 2\).

(a) Then \(\lim_{n \to \infty} nP(a_{nh_n} \xi_n^a \in B) = 0\) for any relatively compact set \(B \in \mathcal{B}(\mathbb{R}^m \setminus \{0\})\).

(b) \(\lim_{n \to \infty} na_{nh_n} \mathbb{E}(\|\xi_n\|) \mathbb{E}(\|\xi_n\|>a_{nh_n}) = 0\) for \(x > 0\).

Proof.

(a) Let \(\gamma_B := \inf_{x \in B} \|x\|\), which is larger than 0, and \(0 < \epsilon < 2/\alpha - 1\). Markov’s inequality, Proposition A.1 (a) and Potter’s Theorem result in

\[
nP(a_{nh_n} \xi_n^a \in B) \leq nP(\|\xi_n\| > a_{nh_n} \gamma_B) \leq \frac{n}{a_{nh_n} \gamma_B} \mathbb{E}(\|\xi_n\|^2) \leq \frac{C_1}{\gamma_B (nh_n)\epsilon} h_n \to \infty 0,
\]

which we had to show.

(b) Moreover,

\[
nP(a_{nh_n} \xi_n^a \in B) = nP(\|\xi_n\| > a_{nh_n} \gamma_B) + nP(\|\xi_n\| > a_{nh_n} \gamma_B) \mathbb{E}(\|\xi_n\|) \mathbb{E}(\|\xi_n\| > a_{nh_n} \gamma_B) \mathbb{E}(\|\xi_n\|) > \gamma_B \mathbb{E}(\|\xi_n\|) \mathbb{E}(\|\xi_n\|) > a_{nh_n} \gamma_B)
\]

\[
\leq nx\mathbb{E}(\|\xi_n\|^2) a_{nh_n} \gamma_B^2 + n a_{nh_n} \int_{a_{nh_n} \gamma_B}^{\infty} \mathbb{E}(\|\xi_n\|^2) \mathbb{E}(\|\xi_n\|) > a_{nh_n} \gamma_B) \mathbb{E}(\|\xi_n\|) > \gamma_B) \mathbb{E}(\|\xi_n\|) > a_{nh_n} \gamma_B)
\]

\[
\leq C_2 nh_n a_{nh_n} n x \to \infty 0,
\]

where we also used Markov’s inequality.

Lemma A.4. Let \(L_1 = (\sum_{k=1}^{N(1)} \mathbf{j}_k)_{t \geq 0}\) be an \(\mathbb{R}^d\)-valued compound Poisson process and \(f : \mathbb{R} \to \mathbb{R}^{m \times d}\) be a measurable and bounded function with \(\lim_{s \to a} f(x) = f(0)\). Define \(\xi_n = \int_0^{h_n} f(s) \, dL_1(s)\) for \(n \in \mathbb{N}\). Then for any \(0 < \delta \leq 1\) with \(E\|L(1)\|^{\delta} < \infty\) there exists a finite positive constant \(K\) such that

\[
E\|\xi_n\|^{\delta} \leq Kh_n.
\]

Proof. We define the Lévy process \(L^\delta(t) := \sum_{\{k\geq 1\}} \|\mathbf{j}_k\|^{\delta} I\{N(t) \geq 1\}\) for \(t \geq 0\), which satisfies \(E(L^\delta(1)) \leq \infty\) by Sato [42], Corollary 2.5.8. Let the increasing sequence \((T_k)_{k \in \mathbb{N}}\) denote the jump times of \((N(t))_{t \geq 0}\). Then

\[
E\|\xi_n\|^{\delta} \leq \sum_{k=1}^{N(h_n)} E\|f(T_k)\|^{\delta} \|\mathbf{j}_k\|^{\delta} = \int_0^{h_n} E\|f(s)\|^{\delta} L^\delta(ds).
\]

Since \(E\left(\int_0^{h_n} \|f(s)\|^{\delta} L^\delta(ds)\right) = E(L^\delta(1)) \int_0^{h_n} \|f(s)\|^{\delta} ds \leq Ch_n\), we get also \(E\|\xi_n\|^{\delta} \leq Ch_n\).

Note, for an arbitrary driving Lévy process the result is not valid, e.g., Brownian motion. In general we only have \(E\|\xi_n\|^{\delta} \leq Ch_n^{\frac{\delta}{2}}\).

Proof of Proposition A.2. (a) We use the decomposition of \(\xi_n = \xi_n^{(1)} + \xi_n^{(2)}\) as given in the proof of Proposition A.1 and the notation there. Moreover, \(f(0)\mathbf{j}_1 \in \mathscr{L}_a(\mathbb{R}_\alpha, \lambda^{-1} \mu \circ f(0)^{-1} \cdot)\) due to Hult and Lindskog [22], Lemma 2.1 and \(|\mathbf{j}_1| \in \mathscr{L}_a(a_n)\) as well. First, we will show that \(\xi_n^{(1)}\) satisfies the statement. Now, let \(B\) be a relatively compact set in \(\mathcal{B}(\mathbb{R}^m \setminus \{0\})\) with \(\mu(\partial B) = 0\) and \(\gamma_B = \inf_{x \in B} \|x\|\), which is larger than 0. We define

\[
nP(a_{nh_n} \xi_n^{(1)} \in B) = \sum_{l=1}^{\infty} nP\left(a_{nh_n} \sum_{k=1}^{l} f(h_n U_{l,k}) \mathbf{j}_k \in B\right) \mathbb{P}(N(h_n) = l) = \sum_{l=1}^{\infty} a_{nh_n}^l.
\]

(A.12)
Furthermore, (A.6) gives for any $l \geq 1$,

$$0 \leq a_{n,l}^* \leq C_1 nh_n \mathbb{P} \left( a_{nh_n}^{-1} f^* \sum_{k=1}^{l} \| J_k \| > y_B \right) \mathbb{P}(N(1) = l) =: b_{n,l}^*,$$

and for some finite constants $C_2, C_3, C_4 > 0$,

$$\lim_{n \to \infty} b_{n,l}^* = C_2 f^* y_B^{-\alpha} \mathbb{P}(N(1) = l),$$

$$\lim_{n \to \infty} \sum_{l=1}^{\infty} b_{n,l}^* = C_3 \lim_{n \to \infty} nh_n \mathbb{P} \left( a_{nh_n}^{-1} \sum_{k=1}^{N(1)} \| J_k \| > f^{-1} y_B \right) = C_4 f^* y_B^{-\alpha}.$$

where we used that $\sum_{k=1}^{N(1)} \| J_k \|$ and $\sum_{k=1}^{N(1)} \| J_k \|$ are in $\mathcal{R} - \alpha(a_\alpha)$ by Resnick [40], Theorem 6.1 and Proposition 7.4, and by Hult and Lindskog [22], Lemma 2.1, respectively. Since (A.8), (A.12) and $\lim_{n \to \infty} f(h_n U_{1,1}) = f(0)$ P-a.s. yield

$$\lim_{n \to \infty} a_{n,l}^* = \lim_{n \to \infty} nh_n \mathbb{P} \left( a_{nh_n}^{-1} f(0) J_1 \in B \right) = \mu \circ f(0)^{-1}(B),$$

and moreover (A.7) results in

$$\lim_{n \to \infty} a_{n,l}^* = 0 \quad \text{for} \quad l \geq 2,$$

a conclusion of Pratt’s Theorem (see Pratt [35]) is

$$\lim_{n \to \infty} nh_n a_{nh_n}^{-1} f(0) E(\| J_1 \| \in B) = \sum_{l=1}^{\infty} \lim_{n \to \infty} a_{n,l}^* = \mu \circ f(0)^{-1}(B). \quad (A.13)$$

Furthermore, the Lévy measure of $L^{(2)}$ has compact support. Thus, Sato [42], Corollary 25.8, gives that all moments of $\| L^{(2)}(1) \|$ exist. The statement follows then from Lemma A.3 (a), (A.4) and (A.13).

(b) is a conclusion of (a) and Resnick [39], Proposition 3.12.

(c) Step 1. Let $\{ L(t) \}_{t \geq 0}$ be a compound Poisson process as given in (A.5), $f(s) = l_{s \delta d}$ and $\delta > \alpha$ (if $\delta \geq 2$ then in particularly $\delta > \alpha$). Keep in mind that $L(1) \in \mathcal{R} - \alpha(a_\alpha)$ and $J_1 \in \mathcal{R} - \alpha(a_\alpha, \mu / \lambda)$ by Hult and Lindskog [22], Lemma 2.1. Then

$$E(\| L(h_n) \| \delta \mathbb{I}(\| L(h_n) \| \leq a_{nh_n} \alpha)) = E(\| J_1 \| \delta \mathbb{I}(\| J_1 \| \leq a_{nh_n} \alpha)) \frac{\mathbb{P}(N(h_n) = 1)}{h_n}$$

$$+ \sum_{l=2}^{\infty} E \left( \left\| \sum_{k=1}^{l} J_k \right\| \delta \mathbb{I}(\| \sum_{k=1}^{l} J_k \| \leq a_{nh_n} \alpha) \right) \frac{\mathbb{P}(N(h_n) = l)}{h_n}. \quad (A.14)$$

By Resnick [40], Theorem 6.1 and Proposition 7.4, $\| \sum_{k=1}^{l} J_k \| \in \mathcal{R} - \alpha(a_\alpha)$, a conclusion of Karamata’s Theorem is for any $l \geq 1$,

$$\lim_{n \to \infty} nh_n a_{nh_n}^{-\delta} E \left( \left\| \sum_{k=1}^{l} J_k \right\| \delta \mathbb{I}(\| \sum_{k=1}^{l} J_k \| \leq a_{nh_n} \alpha) \right) = l C_3 x^{-\alpha}. \quad (A.15)$$

As in (a) we are allowed to apply Pratt’s Theorem, such that (A.7), (A.8), (A.14) and (A.15) result in

$$\lim_{n \to \infty} na_{nh_n}^{-\delta} E(\| L(h_n) \| \delta \mathbb{I}(\| L(h_n) \| \leq a_{nh_n} \alpha)) = \lambda C_3 x^{-\alpha}. \quad (A.16)$$
Further, let \( \varepsilon \) be arbitrary and \( \delta > \alpha \). Since
\[
\P(\|\xi_n\| > y) \leq \P\left( f^* \sum_{k=1}^{N(h_n)} \|J_k\| > y \right)
\]
for any \( y > 0 \), and \( L^*(t) := f^* \sum_{k=1}^{N(t)} \|J_k\| \) for \( t \geq 0 \) is a compound Poisson process with \( L^*(1) \in \mathcal{A}_\alpha(\alpha_n) \), we have
\[
na_{\varepsilon}^{-\delta} \E(\|\xi_n\|^\delta I(\|\xi_n\| \leq \alpha_n(x + \varepsilon))) \leq na_{\varepsilon}^{-\delta} \P(L^*(h_n) > \alpha_n(x + \varepsilon)) + na_{\varepsilon}^{-\delta} \E\left(L^*(h_n) \delta I(L^*(h_n) \leq \alpha_n(x + \varepsilon))\right),
\]
which converges to \( C_6 x^{-\alpha} \) due to (b) and Step 1.

Step 3. Let \( (L(t))_{t \geq 0} \) be a Lévy process, \( \mathbf{f} \) be arbitrary, \( \delta \geq 2 \) and \( \xi_n = \xi_n^{(1)} + \xi_n^{(2)} \) as given in (A.4).

Further, let \( \varepsilon > 0 \). Then the decomposition
\[
na_{\varepsilon}^{-\delta} \E(\|\xi_n\|^\delta I(\|\xi_n\| \leq \alpha_n(x + \varepsilon))) = na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(1)}\|^\delta I(\|\xi_n^{(1)}\| \leq \alpha_n(x + \varepsilon))) + n2^\delta(2x + \varepsilon)^\delta \E\left(\frac{\|\xi_n^{(2)}\|}{\alpha_n(2x + \varepsilon)} \delta I(\|\xi_n^{(2)}\| \leq \alpha_n(x + \varepsilon))\right)
\]
holds. Further,
\[
\begin{align*}
I_{n,1} &\leq na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(1)}\|^\delta I(\|\xi_n^{(1)}\| \leq \alpha_n(x + \varepsilon))) + n2^\delta(2x + \varepsilon)^\delta \E\left(\frac{\|\xi_n^{(2)}\|}{\alpha_n(2x + \varepsilon)} \delta I(\|\xi_n^{(2)}\| \leq \alpha_n(x + \varepsilon))\right) \\
&\leq na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(1)}\|^\delta I(\|\xi_n^{(1)}\| > \alpha_n(x + \varepsilon))) + na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(2)}\|^\delta I(\|\xi_n^{(2)}\| > \alpha_n(x + \varepsilon))) + nC_6 \alpha_n^{-2} \E(\|\xi_n^{(2)}\|^2) n \to 0 \quad C_8(x + \varepsilon)^{\delta - \alpha}
\end{align*}
\]
by Step 2 and Proposition A.1 (a). In the last inequality we required \( \delta \geq 2 \). Moreover, applying (b) and Proposition A.1 (a) results in
\[
I_{n,2} \leq n \P(\|\xi_n^{(2)}\| > \alpha_n(x + \varepsilon)) \P(\|\xi_n^{(1)}\| > \alpha_n(x + \varepsilon)) \leq C_6 e^{-2\alpha_n} \alpha_n^{-2} n \P(\|\xi_n^{(1)}\| > \alpha_n(x + \varepsilon)) \to 0.
\]
Thus, (c) follows.

(d) Let \( \varepsilon \in (0, 1) \). We use the upper bound
\[
na_{\varepsilon}^{-\delta} \E(\|\xi_n\|^\delta I(\|\xi_n\| > \alpha_n(x + \varepsilon))) \leq na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(1)}\|^\delta I(\|\xi_n^{(1)}\| > \alpha_n(x + \varepsilon))) + na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(2)}\|^\delta I(\|\xi_n^{(2)}\| > \alpha_n(x + \varepsilon))) + na_{\varepsilon}^{-\delta} \E(\|\xi_n^{(2)}\|^\delta I(\|\xi_n^{(2)}\| > \alpha_n(x + \varepsilon)))
\]
\[
= I_{n,1} + I_{n,2} + I_{n,3} + I_{n,4}. \quad (A.17)
\]
As in (c) we can show that by Karamata’s and Pratt’s Theorem the compound Poisson process \( (L^*(t))_{t \geq 0} \) satisfies
\[
\lim_{n \to \infty} na_{\varepsilon}^{-\delta} \E(\|L^*(h_n)\|^\delta I(\|L^*(h_n)\| > \alpha_n(x + \varepsilon))) = \lambda C_{10} x^{-\alpha}, \quad (A.18)
\]
and
\[
I_{n,1} \leq 2^\delta n \P(\|\xi_n^{(1)}\| > \alpha_n(x + \varepsilon)) \leq C_{11} x^{-\alpha} \quad \forall n \in \N.
\]
Further, by (b) and Proposition A.1 (a)
\[
I_{n,2} \leq 2^\delta n \P(\|\xi_n^{(2)}\| > \alpha_n(x + \varepsilon)) \to 0. \quad (A.19)
\]
holds. Moreover, by Lemma A.4
\[ I_{n,3} = a_{nh}^{-\delta} 2^{\delta} \mathbb{E}[\mathbb{E}(\xi_n^{(1)} \mid \|a_{nh} \xi_n\| > a_{nh} x) \leq C_{12} a_{nh}^{-\delta} \frac{\delta}{2} n b_{nh} a_{nh}^{-2} x^{-2} e^{-2 n^{-\alpha}} \to 0. \] (A.20)

Finally, by Lemma A.3 (b), \( \lim_{n \to \infty} I_{n,4} = 0. \) Statement (d) is then a consequence from (A.17)-(A.20).

(e) Step 1. Let \( 1 < \alpha < 2. \) Then \( \mathbb{E}(\xi_n^2) = \theta_{n,\delta}. \) Hence,
\[ na_{nh}^{-1} \mathbb{E}(\mathbb{E}(\xi_n^2 \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\})) = na_{nh}^{-1} \mathbb{E}(\mathbb{E}(\xi_n^2 \mathbb{1}\{\|\xi_n\| > a_{nh} \xi_n\})) \leq na_{nh}^{-1} \mathbb{E}(\|\xi_n\| \mathbb{1}\{\|\xi_n\| > a_{nh} \xi_n\}) \]
such that we can apply (d).

Step 2. Let \( \alpha \in (0, 1). \) Again we use the decomposition of \( \xi_n = \xi_n^{(1)} + \xi_n^{(2)} \) as given in (A.4). Thus,
\[ \mathbb{E}(\xi_n \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\}) = \mathbb{E}(\xi_n^{(1)} \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\}) + \mathbb{E}(\xi_n^{(2)} \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\}) =: I_{n,1} + I_{n,2}. \]

On the one hand, let for some \( \varepsilon > 0, \)
\[ \|I_{n,1}\| \leq \int_0^{a_{nh}(x + \varepsilon)} \mathbb{P}(\|\xi_n^{(1)}\| > y, \|\xi_n\| \leq a_{nh} \xi_n) \, dy + \int_{a_{nh}(x + \varepsilon)}^{\infty} \mathbb{P}(\|\xi_n^{(1)}\| > y, \|\xi_n\| \leq a_{nh} \xi_n) \, dy \]
\[ =: I_{n,1.1} + I_{n,1.2}. \]

Then
\[ I_{n,1.1} \leq \mathbb{E}(\xi_n^{(1)} \mathbb{1}\{\|\xi_n\| \leq a_{nh}(x + \varepsilon)\}) + \int_0^{a_{nh}(x + \varepsilon)} \mathbb{P}(\|\xi_n^{(1)}\| > y, \|\xi_n\| > a_{nh} \xi_n) \, dy \]
\[ \leq \mathbb{E}(\xi_n^{(1)} \mathbb{1}\{\|\xi_n\| \leq a_{nh}(x + \varepsilon)\}) + a_{nh}(x + \varepsilon) \mathbb{P}(\|\xi_n\| > a_{nh} \xi_n). \]

Hence, by (c) and Proposition A.1 (a)
\[ \limsup_{n \to \infty} na_{nh}^{-1} I_{n,1.1} \leq C_{13} x^{1-\alpha} + C_{14} \limsup_{n \to \infty} n \mathbb{E}(\xi_n^{(2)} \|a_{nh}^{-1} = C_{13} x^{1-\alpha}. \]

Furthermore,
\[ I_{n,1.2} \leq \int_{a_{nh}(x + \varepsilon)}^{\infty} \mathbb{P}(\|\xi_n^{(1)}\| > y, \|\xi_n\| > y - a_{nh} \xi_n) \, dy \leq \mathbb{P}(\|\xi_n^{(1)}\| > a_{nh}(x + \varepsilon)) \mathbb{E}(\xi_n^{(2)}). \]
\[ \text{such that by (b) and Proposition A.1 (a),} \]
\[ \limsup_{n \to \infty} na_{nh}^{-1} I_{n,1.2} = 0. \]

To conclude, \( na_{nh}^{-1} I_{n,1} \leq C_{14} x^{1-\alpha} \forall n \in \mathbb{N}. \) On the other hand, we have
\[ \|I_{n,2}\| \leq \mathbb{E}(\mathbb{E}(\xi_n^{(2)} - \mathbb{E}(\xi_n^{(2)}) \mathbb{1}\{\|\xi_n\| > a_{nh} \xi_n\})) + \mathbb{E}(\mathbb{E}(\xi_n^{(2)}) \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\})\]
\[ \leq \mathbb{E}(\|\xi_n^{(2)}\| \mathbb{1}\{\|\xi_n\| > a_{nh} \xi_n\}) + \mathbb{E}(\|\xi_n^{(2)}\| \mathbb{1}\{\|\xi_n\| \leq a_{nh} \xi_n\}) + 2 \mathbb{E}(\xi_n^{(2)}). \]
\[ =: I_{n,2.1} + I_{n,2.2} + I_{n,2.3}. \]

Then by (b), Proposition A.1 (a), \( \mathbb{E}(\xi_n^{(2)}) \leq C_{15} h_n \) and \( \alpha \in (0, 1), \)
\[ na_{nh}^{-1} I_{n,2.1} = a_{nh}^{-1} \mathbb{E}(\xi_n^{(2)} \mathbb{1}\{\|\xi_n\| > a_{nh} \xi_n\}) \mathbb{P}(\|\xi_n\| > a_{nh} \xi_n \to 0, \]
\[ na_{nh}^{-1} I_{n,2.3} \leq C_{16} x a_{nh}^{-1} \to 0. \]
Finally, by Markov's inequality
\[
na_{nh_n}^{-1}f_{n,2} = 2\mathbb{P}(\|\xi_n\|_2^2 > a_{nh_n}x/2) + na_{nh_n}^{-1}\int_{a_{nh_n}x/2}^{\infty} \mathbb{P}(\|\xi_n\|_2^2 > y) dy \leq C_1na_{nh_n}x/2 \rightarrow 0,
\]
and thus, \(\lim_{n \to \infty} na_{nh_n}^{-1}f_{n,2} = 0.\)
