The basic problem faced in geophysical fluid dynamics is that a mathematical description based only on fundamental physical principles, the so-called “Primitive Equations”, is often prohibitively expensive computationally, and hard to study analytically. In this talk I will survey the main obstacles in proving the global regularity for the three-dimensional Navier-Stokes equations and their geophysical counterparts. Even though the Primitive Equations look as if they are more difficult to study analytically than the three-dimensional Navier-Stokes equations I will show in this talk that they have a unique global (in time) regular solution for all initial data.

Inspired by this work I will also provide a new global regularity criterion for the three-dimensional Navier-Stokes equations involving the pressure.

This is a joint work with Chongsheng Cao.

**Termin:** Freitag, 26.11.2010, 14:00 Uhr

**Ort:** Neuer Hörsaal, Gebäude 20.40

**Gastgeber:** Die Dozenten des Schwerpunktes Partielle Differentialgleichungen
