Forecasting: Theory and Practice I

Prof. Dr. Tilmann Gneiting

Winter Semester 2020/21

Lecture: Tuesday 14:00–15:30, live via Zoom (Tilmann Gneiting)
Problem classes: Tuesday 8:00–9:00, live via Zoom (Johannes Resin)

Classes will be held online at the scheduled time. Participation is via Zoom and voluntary. Lectures will take place weekly November 3 through February 16, except for December 29 and January 5. The first problem class will take place November 17. Anticipated dates for further problem classes are December 1 and 15, January 12 and 19, and February 2 and 16. Meeting IDs and passwords will be shared on ILIAS; please sign up there.

Course contents

A common desire of all humankind is to make predictions for the future. As the future is inherently uncertain, forecasts ought to be probabilistic, i.e., they ought to take the form of probability distributions over future quantities or events. In this class, which comprises Part I of a two semester series, we will study the probabilistic and statistical foundations of the science of forecasting.

The goal in probabilistic forecasting is to maximize the sharpness of the predictive distributions subject to calibration, based on the information set at hand. Proper scoring rules such as the logarithmic score and the continuous ranked probability score serve to assess calibration and sharpness simultaneously, and relate to information theory and convex analysis. As a special case, consistent scoring functions provide decision-theoretically coherent tools for evaluating point forecasts. Throughout, concepts and methodologies will be illustrated in data examples and case studies.

Prerequisites

A firm understanding of the contents of module Probability Theory is essential.

Exams

There will be oral exams (30 minutes) covering both Part I and Part II at dates announced toward the end of summer semester [MATHST28: 8 ECTS in total]. However, there will be no exams prior to the end of summer semester.

Statistical software for forecasting

The problem sets will frequently require the use of a suitable statistical programming language. Any code discussed in class meetings will be in the R language. While you are encouraged to also use R, feel free to work with your standard language if it is suitable.

Literature

Non-technical overviews of the topics covered are available in an editorial (Gneiting 2008) and a review paper (Gneiting and Katzfuss 2014). Key technical references include the papers by Gneiting and Raftery (2007), Gneiting (2011), Gneiting and Ranjan (2013) and Henzi, Ziegel and Gneiting (2019).
